Putting You Back in Control of Your Power Projects

At Ayr, we work with you as true partners to design and manufacture critical power grid equipment delivered on a schedule you control

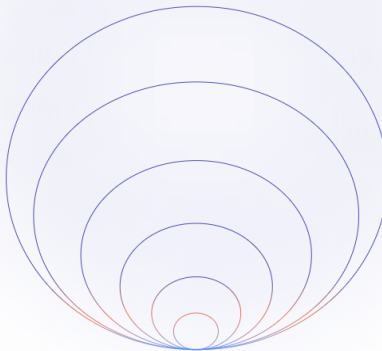

[Talk to Our Experts](#)

The Ayr Difference

← 01 / 04 →

Ownership experience

01

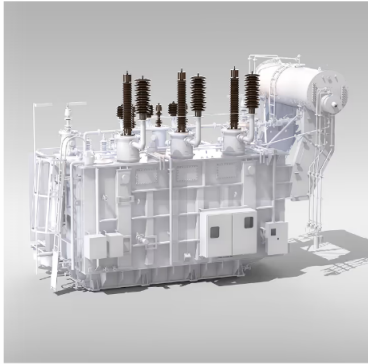

We've reimagined equipment ownership - streamlining every step from engineering to power-on and beyond - to remove bottlenecks and give you clear control over timelines and outcomes.

Quality Power Equipment, On Your Terms

← →

01 | Power Transformers

High-capacity units engineered for generation and transmission, ensuring maximum reliability for utility substations and grid-scale projects

02 | Medium Voltage Transformers

Oil-filled and dry-type units for inverter-duty, commercial & industrial (C&I), and utility distribution, delivered deployment-ready in as little as 12-16 weeks

03 | Special Purpose Transformers

Purpose-built solutions for harsh industrial environments and complex configurations such as high harmonics loads, multi-LV, multi-tap, and more

04 | High-Voltage Transformers

Advanced protection built for dependable control in critical transmission applications

This Is What Certainty Looks Like

250+

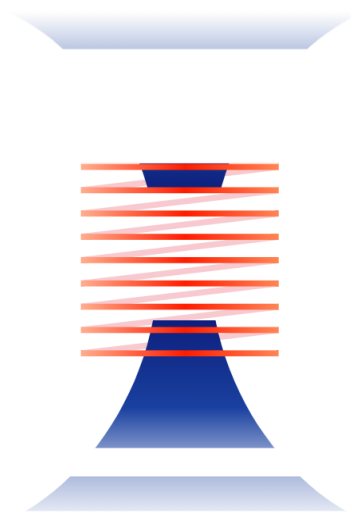

Years of engineering experience across our team

20+ GW

New project capacity underway Powered by Ayr

1.5x *

Faster delivery vs. industry average

*Ayr Energy's Power transformer lead times range from 40-72 weeks, vs industry average of 120 weeks in 2024 per a Wood Mackenzie report

Your Partner For The Long Haul

From commissioning and maintenance to emergency response, our on-ground teams provide complete lifecycle support for your critical infrastructure

Talk to an Expert

Built to the Highest Standards

ISO certified facilities, NABL-certified testing labs, IEEE®, ANSI®, and IEC compliant designs

60+ GVA manufacturing capacity, coupled with deep supply chain control

Industry-leading delivery timelines up to 50% faster than the industry average

24-48 hour guaranteed service response nationwide through NETA-accredited field teams

The Result of a Real Partnership

Dan Siegel

Chief Executive Officer

"Ayr has been tremendous to work with. Through a moment of legislative uncertainty, they have been responsive and adaptive to our needs both commercially and technically. I am excited for continued opportunities to expand the partnership."

Cassidy DeLine

Chief Executive Officer

"In an industry where delays are the norm, Ayr dives in deep to solve problems, not just accept them. What truly impressed us was their ability to complete safe harbor work in less than a quarter of the time it takes their competitors – they transformed a process that typically drags on for months into a seamless, collaborative process that concludes in a few weeks."

Maayan As

Director - Energy Storage

"Ayr provided us with excellent service and swift production start, enabling us to secure our long-lead items for our projects on time. They are a highly professional and reliable partner."

About us

Modernizing the grid requires more than delivering equipment. It requires engineering expertise, strategic manufacturing partnerships, supply chain agility, lifecycle visibility, and relentless execution. From engineering and procurement through manufacturing, commissioning, and long-term support, Ayr helps customers reduce complexity, accelerate timelines, and move critical infrastructure projects forward with confidence. Founded by industry veterans with more than 250 years of combined engineering expertise, Ayr modernizes how critical grid infrastructure is engineered, sourced, manufactured, delivered, and supported. Our modern delivery model combines deep engineering knowledge, strategic manufacturing partnerships, disciplined quality management, and responsive customer support to simplify project execution while improving visibility, flexibility, and reliability. We serve utilities, renewable energy developers, data centers, industrial facilities, and other critical infrastructure customers across North America with medium and high-voltage power infrastructure solutions backed by rigorous engineering and quality oversight. Every solution is supported by ISO-certified manufacturing facilities, NABL-accredited testing laboratories, and compliance with UL®, ANSI®, and IEEE® standards.

For 250 years, America's progress has been driven by innovation, resilience, and the infrastructure that connects us.

As we celebrate Independence Day, we're proud to support the modernization of the grid that will power the next generation of American growth.

Here's to the builders, engineers, utilities, and partners shaping what's next.
Happy Fourth of July from the Ayr Energy Team!

The strain data centers are putting on the U.S. grid is well covered, and it's no wonder why. According to the [U.S. Department of Energy \(DOE\)](#), electricity consumption by data centers has tripled over the past decade and is projected to double or triple again by 2028. At the low end of that range, U.S. data centers alone would consume more electricity than the United Kingdom did last year.

But what this coverage of AI-fueled demand misses is the underlying strain already in play. Rather than an acute demand problem, today's grid crisis is a result of aging infrastructure that has needed replacement for a long time.

In 2017, the [American Society of Civil Engineers](#) gave U.S. energy infrastructure a D+, citing aging equipment and a grid operating beyond its design capacity. Last year, after a brief improvement, they handed down the same grade. This time, the numbers were sharper: 70% of power transformers and 60% of circuit breakers were already past their expected service life.

The influx of new demand from data centers will likely strain an already aging grid, but then again, the grid was under stress before AI started making waves.

Developers and utilities alike are now faced with two problems: replace an aging fleet, and build for a new demand channel undergoing rapid expansion. The same transformers, switchgear, and breakers are needed for each. Two problems, one supply chain.

Innovation in transformer technology will shape the grid of the future. Innovation in how today's equipment is manufactured, procured, and delivered will solve the grid's most pressing challenges. At Ayr, we're focused on both.

According to survey data released last week, the US Midwest is about to see a record number of new power plants. [Laila Kearney](#) at [Reuters](#) reported that 15 GW of new generating capacity is expected to be added to the MISO grid every year for the next five years.

Every plant that gets financed and permitted needs physical equipment to connect it to the grid. And right now, transformers, circuit breakers, and other components of that connection process are a significant bottleneck for plans like this.

Take transformers for example: lead times are stretching beyond 120 weeks, which means developers would need to have begun commissioning equipment already to hit these timelines.

This isn't a MISO-specific problem. Electrification and data center demand are driving the same dynamic across every major grid in the world.

Until procurement catches up to the pace of planning, the cycle repeats: record targets announced, projects stalled waiting on equipment. Meeting demand at this scale requires a different engagement model between developers and manufacturers — one built around flexibility, modularity, and portfolio-scale partnerships.

Conversations at the [American Clean Power Association \(ACP\)](#) [#CleanPower2026](#) reinforced something we're seeing across the industry.

Developers are balancing entire portfolios while navigating evolving project requirements, interconnection uncertainty, and constantly shifting timelines.

As projects become more complex, grid infrastructure and equipment availability are playing an increasingly important role in determining how quickly new generation can move from development to operation.

One theme came up repeatedly this week: developers need partners that can adapt as projects evolve, rather than simply delivering against a fixed set of assumptions. That's a perspective we share at Ayr.

The industry doesn't just need more equipment capacity: it needs a more responsive approach to delivering critical infrastructure.

Thank you to everyone who stopped by our meeting room or shared their insights throughout the week. We look forward to continuing the conversation. If we didn't get a chance to connect, we'd love to hear from you!

Our team is on the ground at [#CleanPower2026](#)!

The week has started off strong. We kicked off the week on the golf course 🏌️ for the annual [American Clean Power Association \(ACP\)](#) golf tournament. On the conference floor, conversations with developers, EPCs, and power producers are

providing a real-time pulse on the state of energy. A consistent theme: procurement strategies are evolving, and infrastructure readiness is becoming a critical gating factor for project timelines and delivery.

📍 If you're on the ground, we hope you'll join us at 5PM on Wednesday for the Ayr Energy Happy Hour in the Level 1 Exhibit Hall.

...

In just the past five years, there have been sizable shifts in how renewable energy projects are developed.

Developers no longer manage a handful of projects on linear timescales. Instead, they're juggling multiple simultaneously—some of the largest developers have 30 or more at one time. They're also managing near real-time shifts: specs change after orders are placed, financing timelines may compress without warning: entire sites may even be swapped.

These conditions have put pressure on equipment partners to rethink their delivery approach. The single-project ordering cycle's manufacturing, quoting, and engineering processes assumed locked-in specs and runways. Now, developers need a partner who can be flexible and collaborative in meeting the needs of each project's unique pace.

At Ayr, we engage early, build flexibility into specs, and deliver on timelines that match each project's unique pace. We're looking forward to being in Houston for [#CleanPower](#) to meet with developers, hear about their priorities, and find opportunities for partnership.

On June 1-4, Ayr Energy will be at [#CleanPower2026](#) in Houston, hosted by [American Clean Power Association \(ACP\)](#).

For renewable energy developers trying to hit COD, transformer delays can rewrite project economics. If you're a developer, utility, or clean power producer looking to secure on a faster-than-industry timeline, we'd love to connect. We'll be in Meeting Room 332E, Level 3.

Ayr Energy was out in full force last week at [DTECH](#) Data Centers & AI and [AFCOM Arizona Chapter](#) Lunch & Learn, and we're still buzzing about what we heard.

As Arizona's "Silicon Desert" evolves, securing long-lead power equipment is the ultimate competitive advantage. At **Ayr Energy**, we're proud to provide the infrastructure that keeps this region moving at the speed of AI.

If our team didn't get a chance to connect with you out there, let's connect in the comments!

We wrapped up a great week at [IEEE Power & Energy Society \(PES\) T&D Conference 2026](#) in Chicago.

Appreciate all the conversations with utilities, engineers, OEMs, and industry partners across the week. A few themes consistently stood out on the show floor:

- ♦ Growing momentum around 765kV infrastructure as the industry prepares for next-generation transmission projects
- ♦ OEMs showcasing newly developed dead-tank breaker products, while incumbents continue advancing SF6-free switchgear technologies
- ♦ Increased participation from newer and international suppliers as utilities and developers work to meet accelerating grid demand

The conversations reinforced how quickly grid requirements are evolving — and the scale of investment and coordination required across the power ecosystem to support what's ahead.

We appreciate the opportunity to exchange perspectives with others across the industry, working to solve these challenges.

Thanks to everyone who spent time with the Ayr Energy team in Chicago!

This energy startup's bet on 100-year-old grid tech is paying off

Tim De Chant · 6:00 AM PDT · April 15, 2026

Demand for electrical transformers, fueled in part by AI data centers, has grown so high that one prominent investor is backing a new startup that uses a very old technology.

Ayr Energy makes transformers with iron-cores, the same basic tech used in the grid for over a century. A number of other startups have [popped up to dethrone the iron-core transformer](#), but Ayr and its investors think there's plenty of life left in the old tech. Judging by the company's order book, now north of \$500 million, they might be right.

Get it now

"We were considering multiple forms of capital when we started," Anirudh Reddy, co-founder and CEO of Ayr, exclusively told TechCrunch. "It just felt like the opportunity is so large that venture capital gives us the opportunity to take those risks upfront and have the possibility to generate an outsized return."

That opportunity has attracted investors, including Energy Impact Partners. So far, the startup has raised \$25 million across two rounds.

That's not something you hear often about an old, essentially commoditized business. Ayr's competing with giants like GE, Siemens, and Mitsubishi, which have been cranking out transformers for decades.

For much of that time, demand for transformers was relatively predictable. Electricity demand in developed economies was stable and could be easily forecasted. Then the electrification wave coincided with the AI bubble and demand shot through the roof. It's expected to double by the middle of next decade, [according](#) to Global Market Insights.

The existing suppliers, who have seen bubbles inflate and pop before, have been hesitant to invest in new manufacturing lines.

Reddy and his co-founders saw something else at play, though. "When we dug deeper, we realized this demand is being driven by so many different drivers. It's not just one. It could be a sustained super cycle as opposed to short spikes that the industry has seen in the past."

Ayr works with transformer manufacturers in India, who manufacture the devices according to the startup's specifications. The designs are more modular than typical transformers, Reddy said, allowing customers to change their order later in the process.

For many of Ayr's customers, that's helpful. Among them are renewable energy companies, independent power producers, and data center developers. Equipment lead times have grown so long that many have to place orders long before a project is "fully baked," Reddy said, and if things change, they could be stuck with a transformer that's improperly sized for the project. Moreover, the incumbents tailor their transformers to each project, making changes harder.

Ayr and its investors are betting that the surge in demand will carve out space for a new transformer manufacturer. The startup hopes to use the disruption to get its foot in the door, prove itself to customers, and then roll out new technologies like solid-state transformers. "That was our game plan from day one," Reddy said.

Update 2:20 pm ET: Added details about Ayr's funding.
