Figure 1. Wiring Assignments

Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 7–8, Fig. 1.

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>These data edge connections are configured to be electrically connected to the set of data conduits:</p>  <p style="text-align: center;"><b>Figure 17. Example of DDR5 Memory Interconnect</b></p> <p>Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at Figs. 10, 17; <i>see also id.</i> at Figs. 13–14.</p> <p>Moreover, Netlist previously asserted claim 16 of U.S. Patent No. 11,016,918 against Samsung’s DDR5 DIMMs, which recites, among other limitations, “a printed circuit board (PCB) having an interface configured to fit into a corresponding slot connector of a host system, <b>the interface including a plurality of edge connections configured to couple power, data, address and control signals between the memory module and the host system.</b>” <i>See, e.g.,</i> Ex. CC-21 (EDTX Trial Tr. Day 2, 4 (2023)) at 333:9–12 (“Q. And can you tell us about claim 16 of the ’918 Patent? A. So here’s claim 16 of the ’918, and a claim analysis is just where I actually look at the claims and compare it to exactly how the products operate, the accused products.”). Netlist also asserted claim 1 of the ’918 patent, which recites, among other limitations, “a printed circuit board (PCB) having an interface configured to fit into a corresponding slot connector of a host system, the interface including a plurality of edge connections configured to couple power, data, address and control signals between the memory module and the host system” and “at least one circuit coupled between a first portion of the plurality of edge connections and the plurality of SDRAM</p> |

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>devices, the at least one circuit operable to (i) receive a first plurality of address and control signals via the first portion of the plurality of edge connections, and (ii) output a second plurality of address and control signals to the plurality of SD RAM devices, . . . .” <i>Id.</i> at 342:8–9 (“Next, I turned to claim 1 of the ’918. Now, as we’ll see, claim 1 only applies to the RDIMM products.”).</p> <p>Samsung did not dispute these limitations. <i>Id.</i> at 885:24–886:5 (“With regard to the ’918 claims, I have determined that—that these claims are not infringed by the Samsung DDR5 product, at least for the reason that there is a limitation in each of the independent claims directed to the requirement of a converter circuit structure, and that is not found on any of these Samsung DDR5 products. And what’s being pointed to is a linear drop-out regulator, but that’s not a converter circuit.”).</p> |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                                                                                                                                   | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |          |             |                        |                               |                        |                   |                |                    |      |                              |      |                                    |         |                           |         |                         |       |                          |      |                                       |      |                                      |     |                                         |      |                       |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         |  <p>The diagram illustrates the internal structure and connections of a Samsung DDR5 RDIMM. It shows two main sections: a top section connected to an RCD (Row Address Decoder) and a bottom section connected to a PMIC (Power Management IC). The top section contains two rows of data cells: D06-D10 and D26-D30 in the top row, and D01-D05 and D21-D25 in the bottom row. The bottom section contains two rows of data cells: D11-D15 and D31-D35 in the top row, and D16-D20 and D36-D40 in the bottom row. Blue lines represent Address, Control and Clock lines connecting the data cells to the RCD and PMIC. A legend at the bottom indicates that blue lines represent Address, Control and Clock lines.</p> <p>Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 33 (showing control and address lines from edge connections to RCD for a 2Rx4 RDIMM); <i>see also id.</i> at 29 (1Rx4), 25 (2Rx8), 21 (1Rx8). These edge connections are configured to be electrically connected to the corresponding connectors of the control/address conduits in the memory slot.</p> |

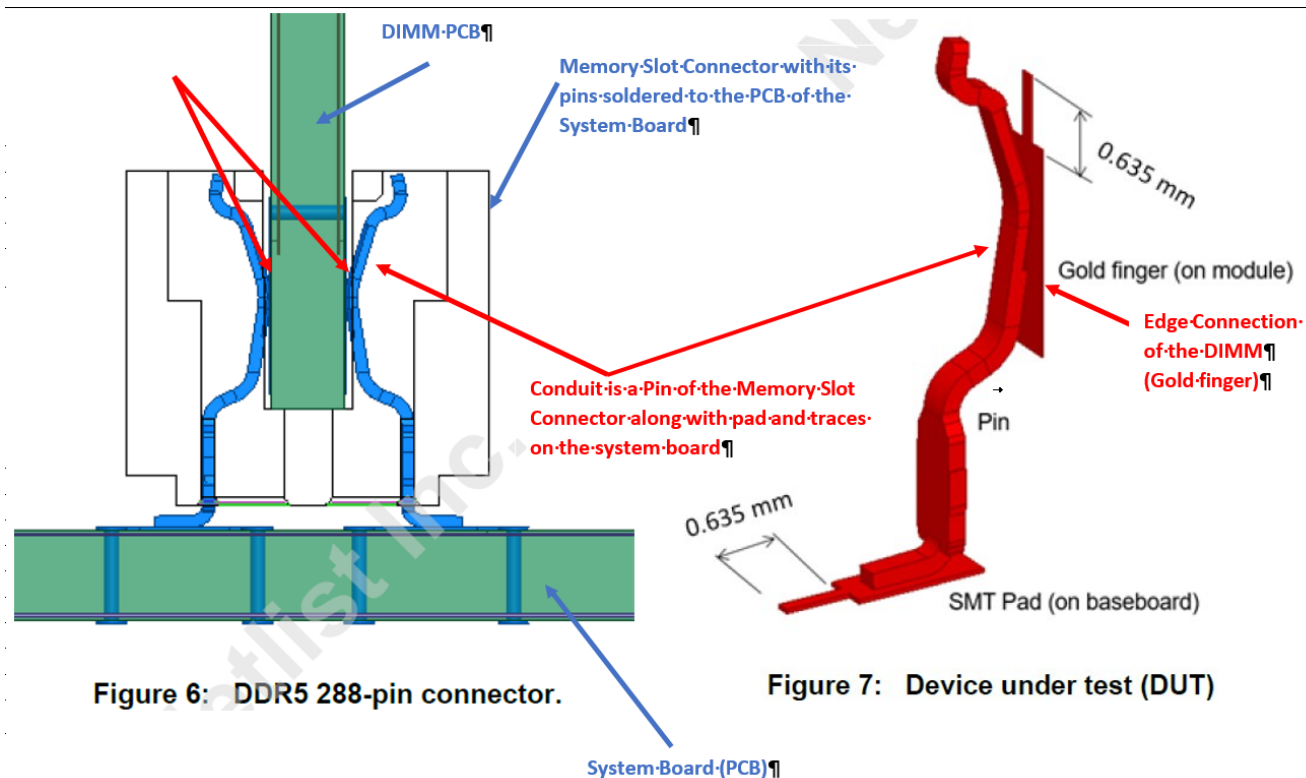

Figure 6: DDR5 288-pin connector.

Figure 7: Device under test (DUT)

Ex. CC-73 (JEDEC PS-005B) at 13, Figs. 6 and 7 (annotated).

Moreover, Netlist previously asserted claim 16 of U.S. Patent No. 11,016,918 against Samsung's DDR5 DIMMs, which recites, among other limitations, "a printed circuit board (PCB) having an interface configured to fit into a corresponding slot connector of a host system, **the interface including a plurality of edge connections configured to couple power, data, address and control signals between the memory module and the host system.**" *See, e.g.,* Ex. CC-21 (EDTX Trial Tr. Day 2, 4 (2023)) at 333:9–12 ("Q. And can you tell us about claim 16 of the '918 Patent? A. So here's claim 16 of the '918, and a claim analysis is just where I actually look at the claims and compare it to exactly how the products operate,

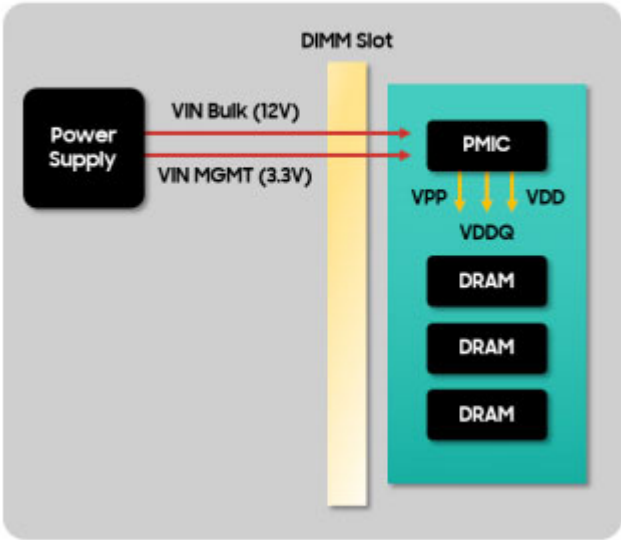

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

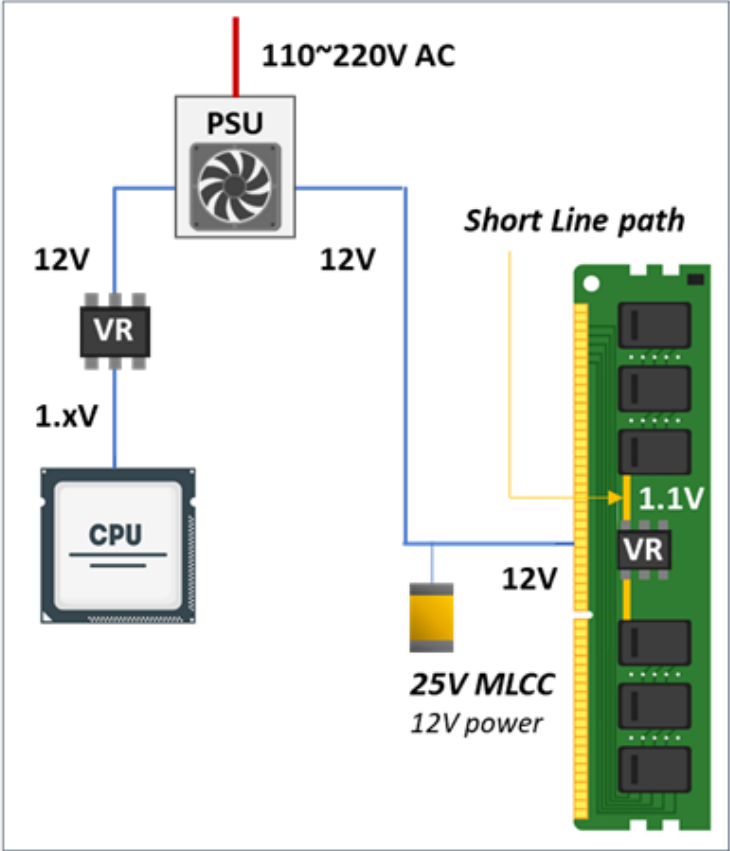

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>the accused products.”). Netlist also asserted claim 1 of the ’918 patent, which recites, among other limitations, “a printed circuit board (PCB) having an interface configured to fit into a corresponding slot connector of a host system, the interface including a plurality of edge connections configured to couple power, data, address and control signals between the memory module and the host system” and “at least one circuit coupled between a first portion of the plurality of edge connections and the plurality of SDRAM devices, the at least one circuit operable to (i) receive a first plurality of address and control signals via the first portion of the plurality of edge connections, and (ii) output a second plurality of address and control signals to the plurality of SD RAM devices, . . .” <i>Id.</i> at 342:8–9 (“Next, I turned to claim 1 of the ’918. Now, as we’ll see, claim 1 only applies to the RDIMM products.”).</p> <p>Samsung did not dispute these limitations. <i>Id.</i> at 885:24–886:5 (“With regard to the ’918 claims, I have determined that—that these claims are not infringed by the Samsung DDR5 product, at least for the reason that there is a limitation in each of the independent claims directed to the requirement of a converter circuit structure, and that is not found on any of these Samsung DDR5 products. And what’s being pointed to is a linear drop-out regulator, but that’s not a converter circuit.”).</p> |

| Claim 1                                                                                                                                                                                                                                                                                                                       | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>[1.a.4]</b> a set of voltage supply lines electrically connected to the first set of edge connections and configured to receive the power delivered to the DIMM from the power rails of the system board by way of the memory slot connector of the system board and the first set of edge connections of the DIMM,</p> | <p>The Accused Instrumentalities each comprise a printed circuit board (PCB) that has a set of voltage supply lines electrically connected to the first set of edge connections. For example, as illustrated in Samsung's DDR5 RDIMM datasheet, there is a set of voltage supply lines electrically connecting the VIN_BULK and VIN_MGMT edge connections on the RDIMM with the corresponding power supply input pins on the PMIC (<i>see below</i>). As illustrated, the set of voltage supply lines is configured to receive the power delivered to the DIMM from the power rails of the system board by way of the memory slot connector of the system board and the first set of edge connections of the DIMM (<i>e.g.</i>, VIN_BULK and VIN_MGMT pins).</p> <div data-bbox="821 779 1589 1097" data-label="Diagram"> <p>The diagram shows a PMIC block with two input pins on the left: VIN_BULK and VIN_MGMT. Inside the PMIC, these inputs connect to a network of internal nodes and capacitors. On the right side of the PMIC, there are six output pins: VDDSPD, VPP, VDD, VDDQ, VDDIO, and VSS. These pins are connected to external components: VDDSPD to SPD_HUB, TS; VPP to D1 - D20; VDD to D1 - D20; VDDQ to D1 - D20 SPD_HUB, TS, RCD; VDDIO to TS, RCD; and VSS to GND. Each output pin has a capacitor connected to ground.</p> </div> <p>Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 10 (showing inputs from VIN_BULK and VIN_MGMT from the board edge to PMIC and then output from PMIC to DIMM components); <i>see also id.</i> at 36, 32, 28, 24.</p> <p>As another example, Samsung illustrates that power is supplied to the DIMM from a power supply off the DIMM via DIMM slots through the edge connections. <i>See</i> Ex. CC-104 (Optimized DDR5 DIMM Solutions).</p> |

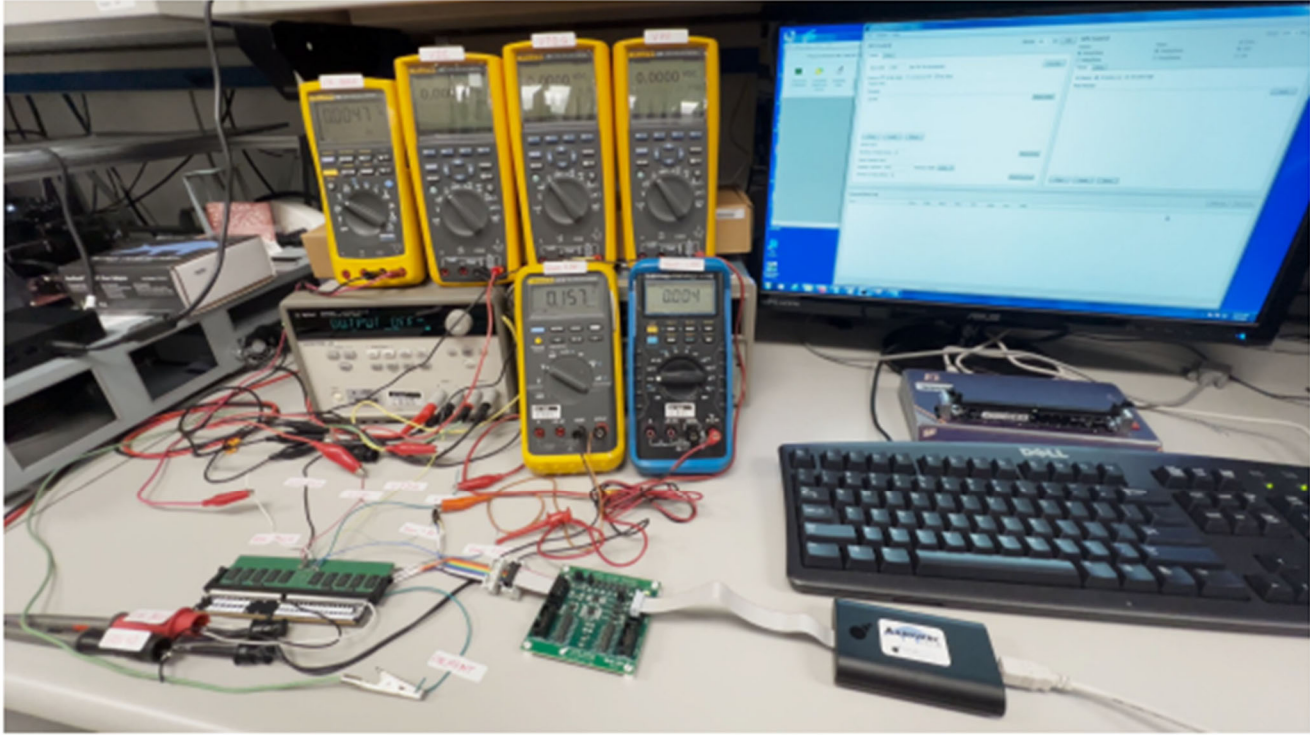

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p align="center"><b>DDR5 DIMM</b></p>  <p>The diagram illustrates the power delivery architecture for a DDR5 DIMM. A Power Supply block on the left is connected to a DIMM Slot. Two red arrows represent the power rails: VIN Bulk (12V) and VIN MGMT (3.3V). These rails pass through the DIMM Slot to a PMIC (Power Management Integrated Circuit) block on the right. The PMIC then provides three output signals: VPP, VDD, and VDDQ, which are connected to three DRAM blocks stacked vertically.</p> <p>The external power supply is delivered from the power rails of the system board by way of the memory slot connector of the system board, as Samsung illustrates at Ex. CC-120 (Samsung, “Memory VR changes in the system by DDR5 adoption”) (the off-DIMM 12V line is an example of power rails of the system board, which would then be fed to the DIMM slot and from the DIMM slot to the power pins of the DIMM’s edge connections).</p> |

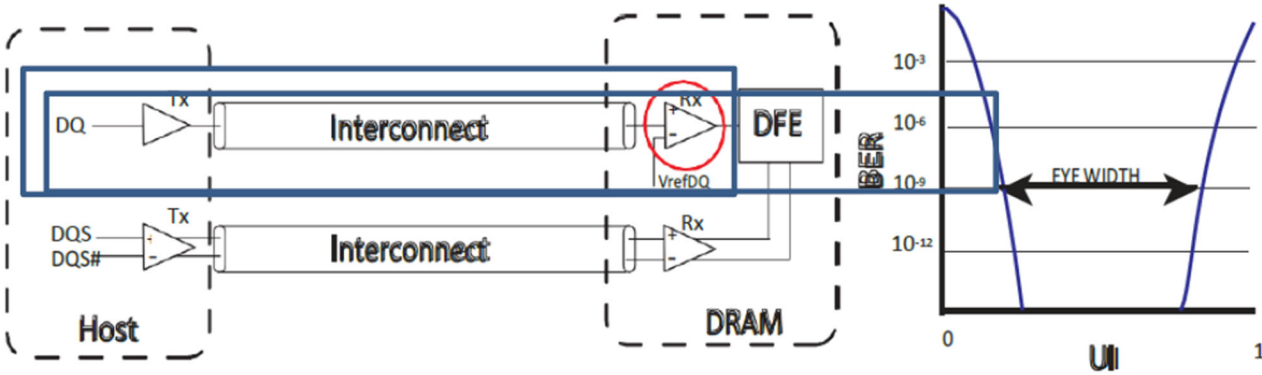

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|         |  <p>The evidence consists of two technical diagrams. Figure 6, titled 'DDR5 288-pin connector', is a cross-sectional view of a connector assembly. It shows a green 'DIMM-PCB' at the top, a white 'Memory-Slot-Connector-with-its-pins-soldered-to-the-PCB-of-the-System-Board' in the middle, and a green 'System-Board-(PCB)' at the bottom. Blue traces connect the DIMM-PCB to the system board. A red arrow points to a specific connection point. Figure 7, titled 'Device under test (DUT)', is a 3D perspective view of a red component. It shows a 'Gold finger (on module)' at the top, an 'Edge-Connection-of-the-DIMM (Gold-finger)' in the middle, and an 'SMT Pad (on baseboard)' at the bottom. A 'Pin' is indicated between the gold finger and the SMT pad. Two dimensions of '0.635 mm' are shown. Red arrows from Figure 6 point to the corresponding parts in Figure 7, illustrating the electrical connection between the connector and the DUT.</p> <p><b>Figure 6: DDR5 288-pin connector.</b></p> <p><b>Figure 7: Device under test (DUT)</b></p> <p>Ex. # U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                                                                                                     | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>[1.a.5]</b> a set of data lines electrically connected to the second set of edge connections, and</p> | <p>The Accused Instrumentalities each comprise a printed circuit board (PCB) having a set of data lines electrically connected to the second set of edge connections (<i>e.g.</i>, connections with pin assignment DQ[31:0]_A, DQ[31:0]_B, CB[7:0]_A, and CB[7:0]_B).</p> <p>For example, as illustrated by Samsung's DDR5 RDIMM Datasheet, there are data interconnects coupling the host's DQ data lines with the DRAM's data lines. The portions of the data lines that are between the DIMM's edge connections for data signals and the corresponding DQ pins of the DRAM packages on the DIMM would be an example of a set of data lines electrically connected to the second set of edge connections for data:</p>  <p><b>Figure 17. Example of DDR5 Memory Interconnect</b></p> <p>Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at Figs. 10, 17; <i>see also id.</i> at Figs. 13–14.</p> <p><i>See also id.</i> at 34–35 (annotated for a 2Rx4 RDIMM) (showing data lines electrically connected to the second set of edge connections (<i>e.g.</i>, lines connecting DQ pins to DRAMs)):</p> |

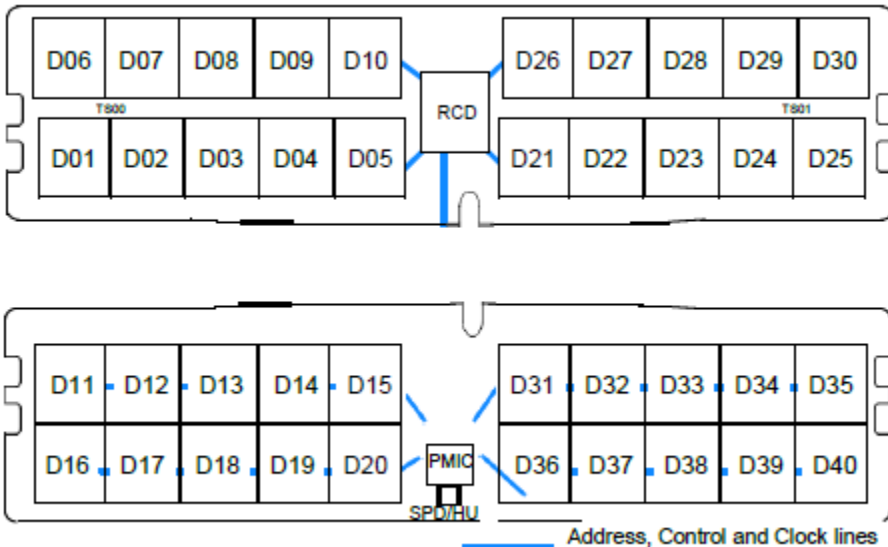

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                        |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p><b>Channel A</b></p> <p>Examples of data lines connected to 2<sup>nd</sup> set of edge connections; for simplicity, only a subset is annotated.</p> |

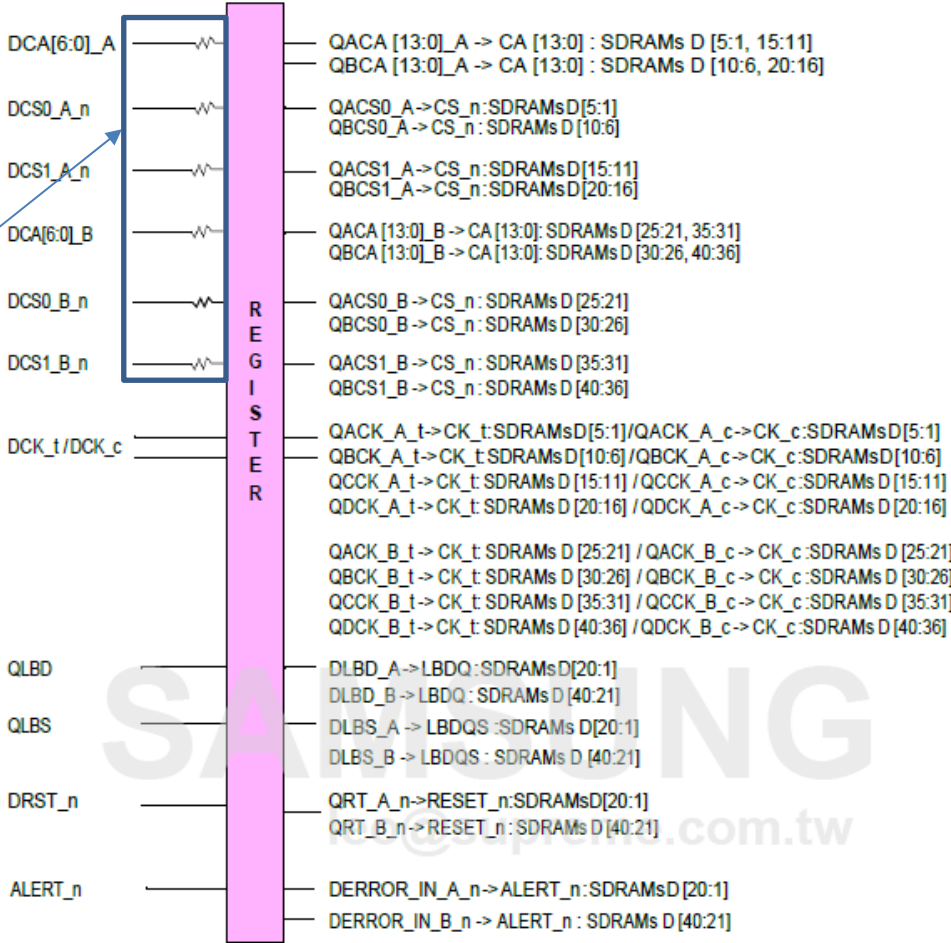

U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|         | <p><b>Channel B</b></p>  <p>The diagram illustrates the electrical connections for Channel B. It shows two columns of memory devices. The left column contains devices D01 through D05, and the right column contains devices D11 through D15. A second set of devices, D06 through D10 and D16 through D20, is shown to the right. Each device is connected to a common signal line (QCS0_A_n or QCS1_A_n), a ZQ line, and a VSS line. Data signals (DQS_t, DQS_c, DQ) are shown for each device. Two vertical blue boxes highlight the DQS_t and DQS_c signals for devices D01-D05 and D06-D10.</p> <p>See also <i>id.</i> at 30–31 (1Rx4 RDIMM), 26–27 (2Rx8 RDIMM), 22–23 (1Rx8 RDIMM).</p> |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                                                                                                               | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>[1.a.6]</b> a set of address and control lines electrically connected to the third set of edge connections;</p> | <p>The Accused Instrumentalities each comprise a printed circuit board (PCB) and a set of address and control lines electrically connected to the third set of edge connections (<i>e.g.</i>, connections with pin assignment CA[6:0]_A, CA[6:0]_B, CS[1:0]_A_n, CS[1:0]_B_n).</p> <p>For example, as illustrated by Samsung's DDR5 RDIMM Datasheet, there are lines going from the edge connections to the RCD inputs and then from the RCD to be output to the corresponding DRAMs:</p>  <p>The diagram illustrates the internal structure of a DDR5 RDIMM. It shows two main sections of DRAMs, each organized into two rows of five cells. The top section contains DRAMs D06-D10 and D26-D30 in the top row, and D01-D05 and D21-D25 in the bottom row. The bottom section contains DRAMs D11-D15 and D31-D35 in the top row, and D16-D20 and D36-D40 in the bottom row. A central RCD (Row Address Decoder) is connected to the edge connections (indicated by blue lines) and outputs signals to the DRAMs. A PMIC (Power Management IC) is also shown, connected to the edge connections and the DRAMs. A legend at the bottom indicates that blue lines represent 'Address, Control and Clock lines'.</p> |

| Claim 1                                                                                                                   | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <div data-bbox="252 638 480 829"> <p>C/A lines<br/>connected to 3<sup>rd</sup><br/>set of edge<br/>connections</p> </div> |  <p>The diagram illustrates a memory module connector with various signal lines. A central vertical pink bar is labeled 'REGISTER'. To the left of this bar, several lines are labeled: DCA[6:0]_A, DCS0_A_n, DCS1_A_n, DCA[6:0]_B, DCS0_B_n, DCS1_B_n, DCK_t/DCK_c, QLBD, QLBS, DRST_n, and ALERT_n. To the right of the bar, corresponding connections to SDRAMs are listed. A blue box highlights the DCA and DCS lines, with an arrow pointing from the text box on the left. A large 'SAMSUNG' watermark is visible in the background.</p> <p>QACA [13:0]_A → CA [13:0] : SDRAMs D [5:1, 15:11]<br/> QBCA [13:0]_A → CA [13:0] : SDRAMs D [10:6, 20:16]<br/> QACS0_A → CS_n : SDRAMs D [5:1]<br/> QBCS0_A → CS_n : SDRAMs D [10:6]<br/> QACS1_A → CS_n : SDRAMs D [15:11]<br/> QBCS1_A → CS_n : SDRAMs D [20:16]<br/> QACA [13:0]_B → CA [13:0] : SDRAMs D [25:21, 35:31]<br/> QBCA [13:0]_B → CA [13:0] : SDRAMs D [30:26, 40:36]<br/> QACS0_B → CS_n : SDRAMs D [25:21]<br/> QBCS0_B → CS_n : SDRAMs D [30:26]<br/> QACS1_B → CS_n : SDRAMs D [35:31]<br/> QBCS1_B → CS_n : SDRAMs D [40:36]<br/> QACK_A_t → CK_t : SDRAMs D [5:1] / QACK_A_c → CK_c : SDRAMs D [5:1]<br/> QBCK_A_t → CK_t : SDRAMs D [10:6] / QBCK_A_c → CK_c : SDRAMs D [10:6]<br/> QCCK_A_t → CK_t : SDRAMs D [15:11] / QCCK_A_c → CK_c : SDRAMs D [15:11]<br/> QDCK_A_t → CK_t : SDRAMs D [20:16] / QDCK_A_c → CK_c : SDRAMs D [20:16]<br/> QACK_B_t → CK_t : SDRAMs D [25:21] / QACK_B_c → CK_c : SDRAMs D [25:21]<br/> QBCK_B_t → CK_t : SDRAMs D [30:26] / QBCK_B_c → CK_c : SDRAMs D [30:26]<br/> QCCK_B_t → CK_t : SDRAMs D [35:31] / QCCK_B_c → CK_c : SDRAMs D [35:31]<br/> QDCK_B_t → CK_t : SDRAMs D [40:36] / QDCK_B_c → CK_c : SDRAMs D [40:36]<br/> DLBD_A → LBDQ : SDRAMs D [20:1]<br/> DLBD_B → LBDQ : SDRAMs D [40:21]<br/> DLBS_A → LBDQS : SDRAMs D [20:1]<br/> DLBS_B → LBDQS : SDRAMs D [40:21]<br/> QRT_A_n → RESET_n : SDRAMs D [20:1]<br/> QRT_B_n → RESET_n : SDRAMs D [40:21]<br/> DERROR_IN_A_n → ALERT_n : SDRAMs D [20:1]<br/> DERROR_IN_B_n → ALERT_n : SDRAMs D [40:21]</p> <p>Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 33 (annotated for a 2Rx4 RDIMM) (showing control and address lines from edge connections to RCD); <i>see also id.</i> at 29 (1Rx4 RDIMM), 25 (2Rx8 RDIMM), 21 (1Rx8 RDIMM). These edge connections are configured to be electrically connected to the corresponding connectors of the control/address conduits in the memory slot.</p> |

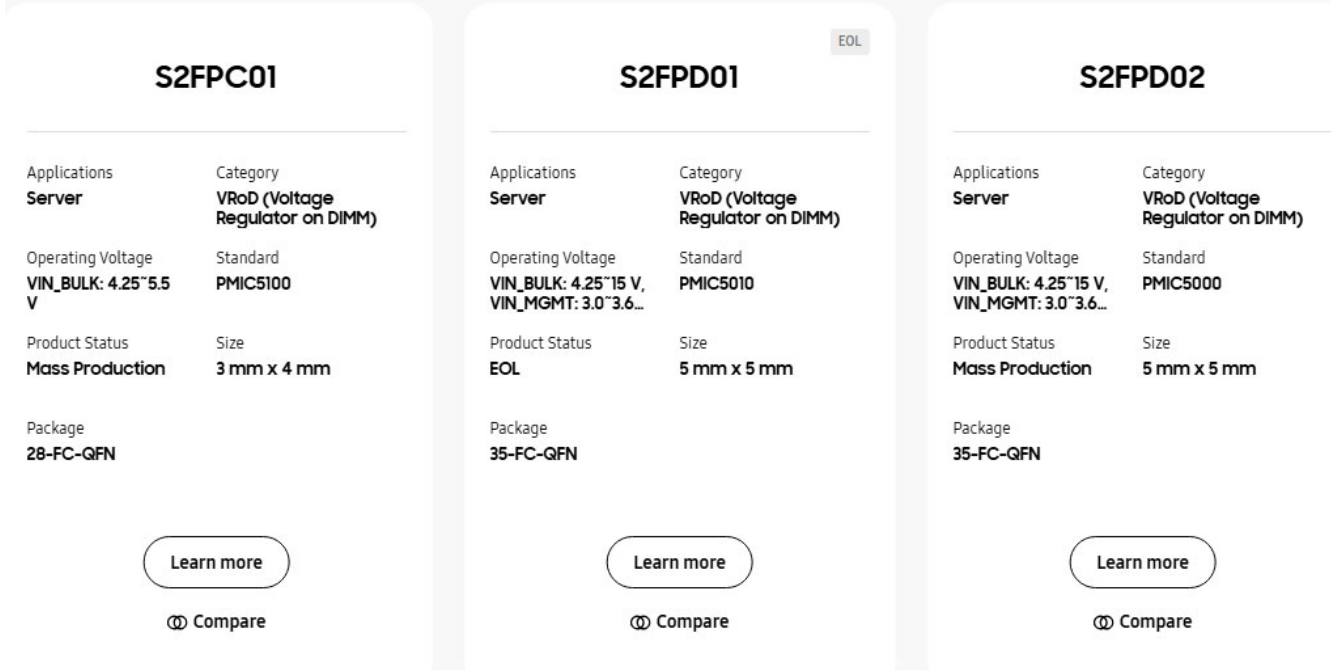

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                                                                                      | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>[1.b]</b> a controller including a voltage monitor circuit and nonvolatile memory,</p> | <p>The Accused Instrumentalities include a controller (such as the non-voltage-converter/regulator portions of the power management IC (“PMIC”)) that includes a voltage monitor circuit and non-volatile memory.</p> <p>Analysis below uses Samsung’s RDIMM format as an example, but MRDIMMs would operate in materially the same way in all relevant part. Ex. CC-13 (JEDEC Press Release) (JEDEC noting that other planned features for MRDIMMs include “Utilization of standard DDR5 DIMM components including DRAM, DIMM Form Factor &amp; Pinout, SPD, PMIC, and TS for ease of adoption”).</p> <p>For example, a Samsung web site illustrates that power is supplied from an external power supply to a PMIC on the DIMM. See Ex. CC-104 (Optimized DDR5 DIMM Solutions).</p> <div data-bbox="898 763 1491 1347" data-label="Diagram"> <p style="text-align: center; color: blue; font-weight: bold;">DDR5 DIMM</p> <p>The diagram illustrates the power architecture of a DDR5 DIMM. On the left, a black box labeled 'Power Supply' is connected to a yellow vertical bar representing the 'DIMM Slot'. Two red arrows originate from the Power Supply: one labeled 'VIN Bulk (12V)' and another labeled 'VIN MGMT (3.3V)'. These arrows point to a black box labeled 'PMIC' (Power Management IC) located on the DIMM. From the PMIC, three yellow arrows point downwards to three stacked black boxes labeled 'DRAM'. The arrows from the PMIC are labeled 'VPP', 'VDD', and 'VDDQ' respectively.</p> </div> <p>Ex. CC-104 (Optimized DDR5 DIMM Solutions).</p> |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

[O]vervoltage, undervoltage, overcurrent limit and over-temperature protections are provided as well.”).</p> |

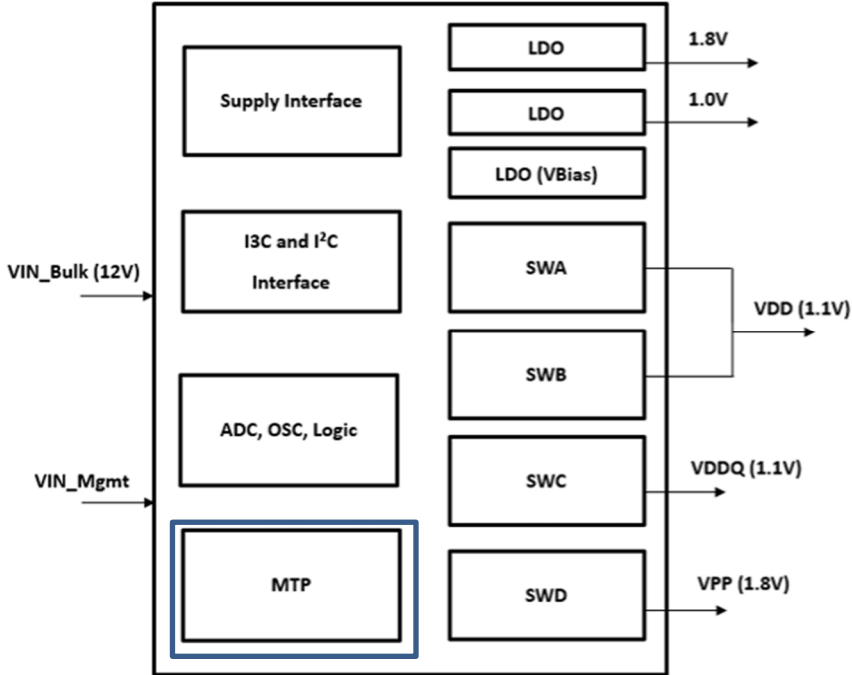

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         |  <p>The diagram shows a PMIC (TPS53830) with two main voltage regulators: VLDO_1.8V and VLDO_1.0V. The VLDO_1.8V regulator is connected to a 1.8V input (VIN) and provides output to a DIMM connector (VIN_MGMT) and a SPD/Hub. The VLDO_1.0V regulator is connected to a 1.0V input (VIN_MGMT) and provides output to a DIMM connector (CAMP) and a SPD/Hub. The DIMM connector is connected to a DIMM module, which provides Clock and Data signals to the SPD/Hub. The SPD/Hub is connected to the DIMM connector and provides SCL, SDA, and AGND signals to the PMIC. The PMIC also has PGND and AGND pins connected to ground. The PMIC is connected to three power rails: VDD (1.1V, 12A), VDDQ (1.1V, 6A), and VPP (1.8V, 5A). Each power rail has a boot switch (BOOT_SWA, BOOT_SWB, BOOT_SWC, BOOT_SWD) and feedback pins (SWAB_FB_P, SWAB_FB_N, SWC_FB_P, SWC_FB_N, SWD_FB_P, SWD_FB_N). The PMIC is also connected to two temperature sensors (TS) and a resistor divider (RCD).</p> <p><i>See also</i> Ex. CC-128 (TPS53830 Product Overview); Ex. CC-129 (TPS53830 Data Sheet); Ex. CC-130 (TPS53832 Product Overview); Ex. CC-26 (TPS53832 Data Sheet).</p> <p>The PMICs on Samsung's DDR5 DIMMs also each include non-volatile memory, such as in the form of MTP (multi-time programmable non-volatile memory) or e-flash. <i>E.g.</i>, Ex. CC-131 (S2FPD01 Brochure) at 2 (annotated):</p> |

U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                       | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |         |                               |             |          |             |                  |                                                                                                                                                                                                                                                                                                                                                                                     |

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>(MTP) Memory”); Ex. CC-123 (MPQ8895F) (“Configurable Slave Address via the Multiple-Time Programmable (MTP) Memory”); Ex. CC-29 (MPQ8894) (“Configurable Slave Address via the Multiple-Time Programmable (MTP) Memory”).</p> <p>Additionally, Samsung’s DIMMs allegedly use PMICs that comply with corresponding JEDEC standards. Ex. CC-104 (Optimized DDR5 DIMM Solutions):</p> <p>As PMICs have evolved, the number and type of power channels has increased accordingly, with server products generally requiring more channels and higher power capacity than client products. This is why server products use a 4-channel buck converter and a dual low-dropout regulator (2LDO)<sup>1</sup> — and client products use a 3-channel buck converter and 2LDO.<sup>2</sup> Initial plans were to have only one product each for servers and clients, but as DRAM modules increased in capacity and speed, it became clear that necessary power would have to be supplied in different ways, leading to the diversification of products.</p> <p><sup>1</sup>) Server Models: PMIC5000 5010 5020 5030.</p> <p><sup>2</sup>) Client Models: PMIC 5100 5120 5200.</p> <p><i>See also</i> PMIC supplier web links above (JEDEC compliant); Ex. CC-131 (S2FPD01 Brochure) at 1 (“The S2FPD01 fully supports JEDEC standard, as well as PMIC50x0 (Power Management IC Specification Rev1.8, JESD301-1.)”); Ex. CC-132 (S2FPD01 Memory Power IC) (PMIC5010); Ex. CC-133 (S2FPD02 Memory Power IC) (Standard PMIC5000); Ex. CC-134 (S2FPD73 Memory Power IC) (Standard PMIC5020).</p> <p><i>See also</i> Ex. CC-135 (TPS53840 Product Overview) &amp; Ex. CC-136 (TPS53840 Data Sheet) at 1 (“Compliant to JEDEC PMIC5020 for DDR5 MRDIMM and RDIMM”).</p> <p>According to the JEDEC Power Management IC specifications, the PMICs are each to include an input</p> |

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>voltage monitoring circuit and non-volatile memory. For example, the JESD301-1 standard for PMIC5000/PMIC5010 contains the following relevant description.</p> <p><b>2.2 Common Features summary</b></p> <ul style="list-style-type: none"> <li>• VIN_Bulk input supply protection feature: Input over voltage</li> <li>• Multi Time Programmable Non-Volatile Memory</li> </ul> <p>Ex. CC-85 (JESD301-1) (PMIC5000/PMIC5010 standard) at 2; Ex. CC-81 (JESD301-1A) at 2.</p> <p><b>8.15 Input Over Voltage Protection</b></p> <p>An input over voltage protection mechanism is implemented to limit the voltages to the PMIC. The PMIC actively monitors the input voltage VIN_Bulk and VIN_Mgmt rail.</p> <p>Ex. CC-85 (JESD301-1) at 40 (annotated); Ex. CC-81 (JESD301-1A) at 38; <i>see also</i> Ex. CC-83 (JESD301-4A) (PMIC5020 specification) at 2, 38; Ex. CC-137 (JESD301-5) (PMIC5030 specification) at 2, 50.</p> <p>Moreover, Netlist previously asserted claims 16 and 18–19 of U.S. Patent No. 11,016,918 against Samsung’s DDR5 DIMMs, which recites, among other limitations, “<b>a voltage monitor circuit</b> configured to monitor an input voltage received via a first portion of the plurality of edge connections, the voltage monitor circuit configured to produce a signal in response to the input voltage having a voltage amplitude that is greater than a first threshold voltage,” “<b>a controller coupled to the voltage monitor circuit</b> and configured to receive the signal, wherein the controller executes a write operation in response to the signal,” and “wherein the write operation includes writing data information into <b>non-volatile memory</b>.” ’918 Patent, claims 16, 18–19 (emphasis added). <i>See, e.g.</i>, Ex. CC-21 (EDTX Trial Tr. Day 2, 4 (2023)) at 333:9–12 (“Q. And can you tell us about claim 16 of the ’918 Patent? A. So here’s claim 16 of the ’918, and a claim analysis is just where I actually look at the claims and compare it to exactly how the products operate, the accused products.”), 381:24–25 (“Q: And what claim did you analyze next? A: Next, I turned to claim 18 . . . .”), 341:3 (“Q: Let’s turn to ’918, claim 19.”). Netlist previously asserted claim 16 of U.S. Patent No.</p> |

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>11,232,054 against Samsung’s DDR5 DIMMs, which requires among other things, “a printed circuit board (PCB) having an interface configured to fit into a corresponding slot connector of a host system” and “a controller coupled to the PCB, the controller including a voltage monitor circuit coupled to an input voltage received from the host system via the interface.” <i>Id.</i> at 345:12–13 (“Q: which claim did you analyze next? A: Next, I turned to claim 16 of the ’054 Patent.”).</p> <p>Samsung did not dispute these limitations. <i>Id.</i> at 885:24–886:9 (“With regard to the ’918 claims, I have determined that—that these claims are not infringed by the Samsung DDR5 product, at least for the reason that there is a limitation in each of the independent claims directed to the requirement of a converter circuit structure, and that is not found on any of these Samsung DDR5 products. And what’s being pointed to is a linear drop-out regulator, but that’s not a converter circuit. As relates to the ’054 claims, the DDR5 product has a normal operating state. The other state is it’s turned off. So it does not have a second operable state as required by the ’054 claims.”).</p> |

|                                | <table border="1"> <thead> <tr> <th>Pin Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>DQ[31:0]_A<br/>DQ[31:0]_B</td><td>DIMM memory data bus channel A and B</td></tr> <tr> <td>CB[7:0]_A<br/>CB[7:0]_B</td><td>DIMM ECC check bits(CB) channel A and B</td></tr> <tr> <td>DQS[9:0]_A_t<br/>DQS[9:0]_B_t</td><td>SDRAM data strobes<br/>(positive line of differential pair)</td></tr> <tr> <td>DQS[9:0]_A_c<br/>DQS[9:0]_B_c</td><td>SDRAM data strobes<br/>(negative line of differential pair)</td></tr> <tr> <td>TDQS[9:5]_A_t<br/>TDQS[9:5]_B_t</td><td>Not valid for x4 operation.<br/>Enabled via Mode Register.</td></tr> <tr> <td>TDQS[9:5]_A_c<br/>TDQS[9:5]_B_c</td><td>Not valid for x4 operation.<br/>Enabled via Mode Register.</td></tr> <tr> <td>VIN_BULK</td><td>DIMM Power Supply from system to PMIC</td></tr> <tr> <td>VIN_MGMT</td><td>DIMM Power Supply from system to PMIC</td></tr> <tr> <td>VSS</td><td>Power supply return (ground)</td></tr> <tr> <td>RFU</td><td>Reserved for future use</td></tr> <tr> <td>LBDQS</td><td>Loopback data strobe output</td></tr> </tbody> </table> <p>Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 9, Table 5 (annotated).</p> <p>Furthermore, as noted above, the controller includes a voltage monitor circuit that monitors the input overvoltage. Thus, the controller is coupled to the VIN_BULK and VIN_MGMT voltage supply lines, because otherwise, the voltage monitor circuit would not be able to monitor these voltage supply lines.</p> <p>Moreover, Netlist previously asserted claims 16 and 5 of U.S. Patent No. 11,016,918 against Samsung's DDR5 DIMMs, which recites, among other limitations, <b>"a voltage monitor circuit configured to monitor an input voltage received via a first portion of the plurality of edge connections"</b> and <b>"a voltage monitor circuit configured to monitor a power input voltage received via a second portion of the plurality of edge connections, . . ."</b> '918 Patent, claims 16 and 5 (emphasis added). <i>See, e.g.</i>, Ex. CC-21 (EDTX Trial Tr. Day 2, 4 (2023)) at 333:9–12 ("Q. And can you tell us about claim 16 of the '918 Patent? A. |         | <p>claim 16 of the '918, and a claim analysis is just where I actually look at the claims and compare it to exactly how the products operate, the accused products.”), 381:24–25 (“Q: And what claim did you analyze next? A: Next, I turned to claim 18 . . .”), 344:17–19 (“Q: Let’s turn to claim 5. Have you shown evidence of overvoltage monitoring? A: Yes. Indeed, I have in my analysis of claim 16.”). Netlist previously asserted claim 16 of U.S. Patent No. 11,232,054 against Samsung’s DDR5 DIMMs, which requires among other things, “a printed circuit board (PCB) having an interface configured to fit into a corresponding slot connector of a host system,” “a voltage conversion circuit [which is part of a PMIC] coupled to the PCB,” and “a controller coupled to the PCB, the controller including a voltage monitor circuit coupled to an input voltage received from the host system via the interface, the voltage monitor circuit configured to detect an amplitude change in the input voltage.” <i>Id.</i> at 345:12–13 (“Q: which claim did you analyze next? A: Next, I turned to claim 16 of the '054 Patent.”).</p> <p>Samsung did not dispute these limitations. <i>Id.</i> at 885:24–886:9 (“With regard to the '918 claims, I have determined that—that these claims are not infringed by the Samsung DDR5 product, at least for the reason that there is a limitation in each of the independent claims directed to the requirement of a converter circuit structure, and that is not found on any of these Samsung DDR5 products. And what’s being pointed to is a linear drop-out regulator, but that’s not a converter circuit. As relates to the '054 claims, the DDR5 product has a normal operating state. The other state is it’s turned off. So it does not have a second operable state as required by the '054 claims.”).</p> |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |         |                               |             |          |             |                  |                                                                                                                                                                                                                                                                                                                                                                              |

| <p><b>[1.b.2]</b> the voltage monitor circuit configured to: (i) monitor an input voltage supplied via the input voltage supply line; (ii) generate a trigger signal upon detecting a trigger condition; and (iii) transmit the trigger signal to at least one other portion of the controller,</p> <p>wherein the controller is configured to perform, in response to the trigger signal, a write operation to write data into the nonvolatile memory, and</p> <p>wherein the trigger condition occurs when the input voltage exceeds a first threshold voltage;</p> | <p>As the evidence cited for elements 1b and 1b.1 demonstrates, Samsung’s DDR5 DIMMs includes a PMIC having a voltage monitor that is configured to monitor an input voltage supplied via the input voltage supply line where the trigger occurs when the input voltage exceeds a first threshold voltage (<i>i.e.</i>, when there is an input over-voltage condition) because otherwise, it would not be commercially viable for the voltage monitor circuit to provide the featured input overvoltage lockout (OVLO) or overvoltage protection. <i>See, e.g.</i>,</p> <p>Ex. CC-131 (“S2FPD01 Brochure”) at 2 (annotated):</p> <table border="1"> <thead> <tr> <th></th><th>S2FPD01</th></tr> </thead> <tbody> <tr> <td>VIN_BULK (VINA/INB/VINC/VIND)</td><td>4.25V ~ 15V</td></tr> <tr> <td>VIN_MGMT</td><td>3.0V ~ 3.6V</td></tr> <tr> <td>Power Management</td><td>           Input UVLO/OVLO, Thermal Shut Down function<br/>           Read/Write I2C/I3C for Register Control<br/>           Interface up to 1MHz for I2C and 12.5MHz for I3C<br/>           Error Log Count &amp; Storage<br/>           Built-in Nonvolatile Memory registers<br/>           Dynamic Voltage Scaling controlled by I2C/I3C<br/>           Programmable Soft Start &amp; Soft Stop Time<br/>           Current Limit, Over/Under voltage protection<br/>           Power Meter         </td></tr> </tbody> </table> <p>Ex. |                       | <p>with JEDEC’s PMIC standards.</p> <p>According to the JEDEC Power Management IC specifications, an over-voltage condition would trigger a VR disable command. <i>See</i> Ex. CC-85 (JESD301-1) at 36 and 37, Table 30; Ex. CC-81 (JESD301-1A) at 35, Table 27; Ex. CC-83 (JESD301-4A) at 35, Table 23; Ex. CC- 137 (JESD301-5) at 45-46, Table 27.</p> <p><b>8.13 Function Interrupt - PWR_GOOD and GSI_n Output Signals</b></p> <p>This section defines the output functionality of GSI_n pin and PWR_GOOD (Table 145, “Register 0x32” [5] = ‘0’) pin.</p> <p>When mask register bits are not set, the PMIC asserts its GSI_n output and PWR_GOOD output signals as shown in Table 30 when any event occurs. The table also highlights 11 events that causes PMIC to generate internally VR Disable command. For remaining events that does not trigger internal VR Disable command, the PMIC continues to operate as normal.</p> <p>Ex. CC-85 (JESD301-1) at 36 (annotated); Ex. CC-81 (JESD301-1A) at 35; <i>see also</i> Ex. CC-83 (JESD301-4A) at 35; Ex. CC-137 (JESD301-5) at 45.</p> <p><b>Table 30 — Events Interrupt Summary</b></p> <table><tr><th>Event</th><th>Status Bit</th><th>Clear Bit</th><th>Mask Bit</th><th>Threshold Bits</th><th>Trigger VR Disable?</th><th>PWR_GOOD Output</th><th>GSI_n Output</th></tr><tr><td>VIN Bulk Power Good</td><td>R08 [7]</td><td>R10 [7]</td><td>R15 [7]</td><td>R1A [7:5]</td><td>No</td><td>Low</td><td>Low</td></tr><tr><td>VIN Bulk Over Voltage</td><td>R08 [0]</td><td>R10 [0]</td><td>R15 [0]</td><td>R1B [7]</td><td>Yes</td><td>Low</td><td>Low</td></tr><tr><td>VIN Mgmt Over Voltage</td><td>R08 [1]</td><td>R10 [1]</td><td>R15 [1]</td><td>R1B [5]</td><td>No</td><td>High</td><td>Low</td></tr><tr><td>...</td><td>...</td><td>...</td><td>...</td><td>...</td><td>...</td><td>...</td><td>...</td></tr></table> <p>Ex. CC-85 (JESD301-1) at 37 (annotated) (showing that input voltage monitoring is performed for both VIN_BULK and VIN_MGMT); Ex. CC-81 (JESD301-1A) at 35 (same); <i>see also</i> Ex. CC-83 (JESD301-4A) at 35 (Table 23); Ex. CC-137 (JESD301-5) at 45-46.</p> <p>The VR Disable Command, which itself can be considered a trigger signal, is generated in response to a trigger signal—such as an input over-voltage detection or alert signals output by the voltage monitor circuit (<i>e.g.</i>, as a result of a comparison by a comparator of the detected input voltage to a reference voltage corresponding to a threshold voltage set by an overvoltage threshold register).</p> | Event     | Status Bit | Clear Bit      | Mask Bit            | Threshold Bits  | Trigger VR Disable? | PWR_GOOD Output | GSI_n Output | VIN Bulk Power Good | R08 [7] | R10 [7] | R15 [7] | R1A [7:5] | No | Low | Low | VIN Bulk Over Voltage | R08 [0] | R10 [0] | R15 [0] | R1B [7] | Yes | Low | Low | VIN Mgmt Over Voltage | R08 [1] | R10 [1] | R15 [1] | R1B [5] | No | High | Low | ... | ... | ... | ... | ... | ... | ... | ... |

|         | <p>Table 122 — Register 0x1B</p> <table><tr><th colspan="4">R1B</th></tr><tr><th>Bits</th><th>Attribute</th><th>Default</th><th>Description</th></tr><tr><td>7</td><td>RW</td><td>0</td><td>R1B [7]: VIN_BULK_OVER_VOLTAGE_THRESHOLD<br/>VIN Bulk Input Over Voltage Threshold Setting For GSI_n Assertion<br/>0 = 14.5 V<br/>1 = 16.0 V</td></tr></table> <p>Ex. CC-85 (JESD301-1) at 136 (annotated); Ex. CC-81 (JESD301-1A) at 135; <i>see also</i> Ex. CC-83 (JESD301-4A) at 133, Table 113; Ex. CC-137 (JESD301-5) at 159, Table 132.</p> <p>The trigger signal generated by the voltage monitor circuit is configured to be transmitted by the voltage monitor circuit to other circuitry within the PMIC, e.g., to logic or state machines to determine whether VR Disable Command should issue, and/or to circuitry that would trigger writing to real time status registers (<i>see</i> Ex. CC-81 (JESD301-1A) at 116, Table 98, “Register 0x08”) and/or error log registers. In addition, the VR Disable Command is also transmitted to another portion of the controller, such as the controller circuitry for buck converters to execute a power down sequence in response to the generated VR Disable command. Error log registers would include 0x04 for global error count, and bits 5 and 7 of registers 0x04 would be updated in response to an input over-voltage condition trigger signal. Error log registers would also include 0x05 whose bits [0:2] would be updated to 100 in response to an input over-voltage condition trigger signal.</p> <p>The PMIC is configured to perform, in response to the trigger signal signifying detection of an input over-voltage condition, a write operation to write data into the non-volatile memory, such as duplicating the contents of 0x04 and 0x05 to the corresponding non-volatile memory space.</p> | R1B     |                                                                                                                                           |  |  | Bits | Attribute | Default | Description | 7 | RW | 0 | R1B [7]: VIN_BULK_OVER_VOLTAGE_THRESHOLD<br>VIN Bulk Input Over Voltage Threshold Setting For GSI_n Assertion<br>0 = 14.5 V<br>1 = 16.0 V |

|         | <p><b>8.15 Input Over Voltage Protection</b></p> <p>An input over voltage protection mechanism is implemented to limit the voltages to the PMIC. The PMIC actively monitors the input voltage VIN_Bulk and VIN_Mgmt rail.</p> <p>There are two possibilities where PMIC recognizes the input over voltage event.</p> <ol style="list-style-type: none"> <li>1. VIN_Mgmt input goes above the threshold set in register Table 122, "Register 0x1B" [5].</li> <li>2. VIN_Bulk input goes above the threshold set in register Table 122, "Register 0x1B" [7].</li> </ol> <p>When either one or both event occurs for a period longer than tInput_OV_GSI_Assertion time then PMIC sets the register Table 103, "Register 0x08" [1:0] accordingly and drives GSI_n output signal as shown in Table 30 at the same time. Note that at this point, the PMIC does not assert PWR_GOOD output signal. The PMIC allows access to all registers and PMIC continues to operate as normal. The host is responsible for taking any specific action. The host may clear the VIN_Mgmt or VIN_Bulk input over voltage status register by writing '1' to register Table 111, "Register 0x10" [1:0] appropriately or by writing '1' to global status clear register Table 115, "Register 0x14" [0]. If the input over voltage condition is still present then PMIC will continue to assert GSI_n output signal and the status register Table 103, "Register 0x08" [1:0] will remain at '1'.</p> <p>In programmable mode (i.e., Table 142, "Register 0x2F" [2] = '1'), if VIN_Bulk input supply over voltage condition persists greater than tInput_OV_VR_Disable time then PMIC internally generates VR Disable command and disables all of its switching output regulators and asserts PWR_GOOD signal. The PMIC keeps its VOUT_1.8V and</p> <p>Ex. CC-85 (JESD301-1) at 40 (annotated); Ex. CC-81 (JESD301-1A) at 38; Ex. CC-83 (JESD301-4A) at 38-39, Section 1.8.15; Ex. CC-137 (JESD301-5) at 50-51, Section 6.15.</p> <p>For example, when an input over-voltage conditions, at least bits 5 and 7 of 0x04 and bits 0-2 of 0x05 are updated; and the contents of 0x04 and 0x05 are written into non-volatile memory.</p> |

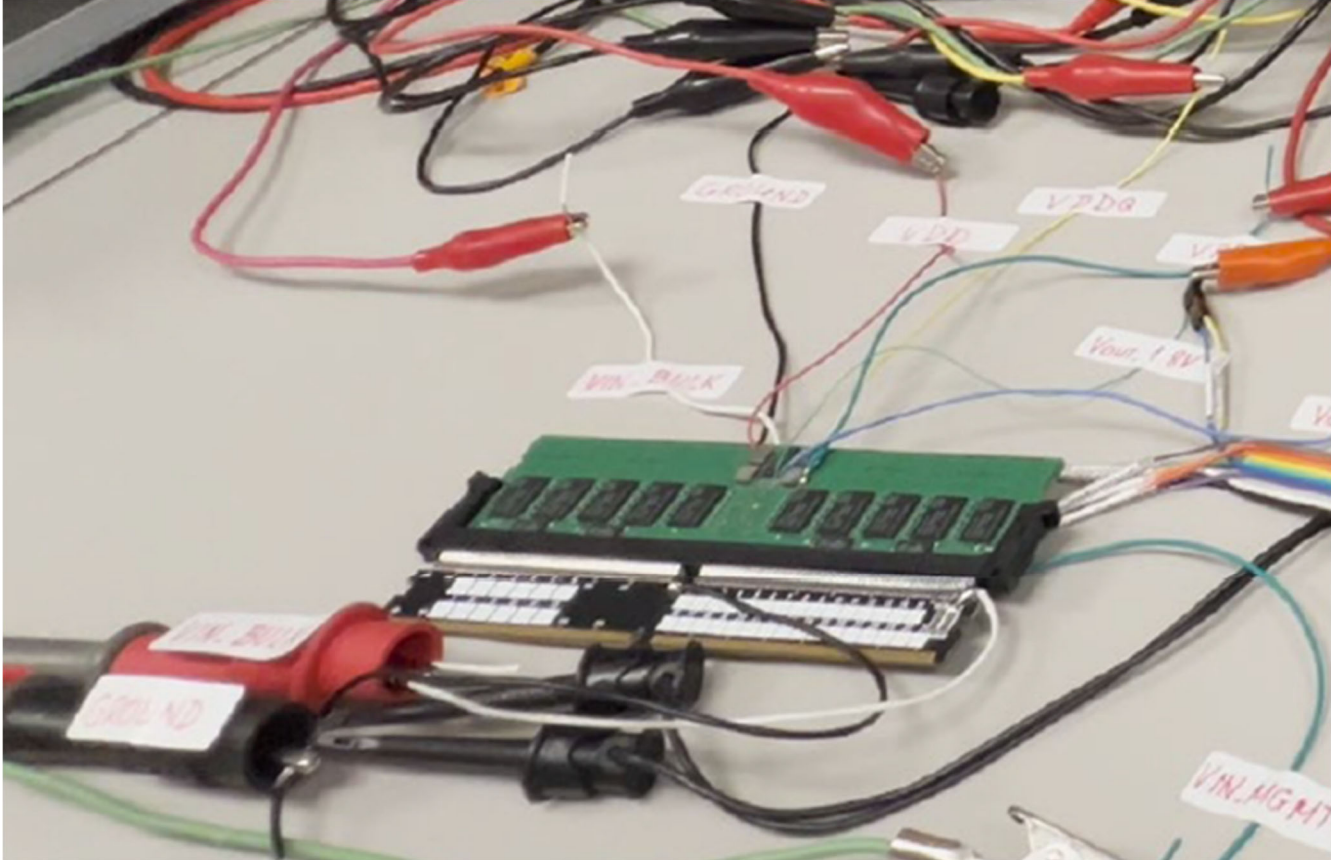

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |                                                                                                                                                                                                               |  |  |      |           |         |                            |   |     |   |                                                                                                                                                                                                               |   |     |   |                                                                                                                                                                                        |   |     |   |                                                                                                                                                                          |   |     |   |                                                                                                                                                                        |     |    |   |                     |

The PMIC always attempts to write this register into its non-volatile memory. However, it may not be guaranteed depending on how fast the host may shut off the input power to the PMIC. The PMIC needs minimum of 5.0V for VIN_Bulk voltage and 100 ms duration from PWR_GOOD signal assertion to guarantee the write operation into non-volatile memory.</p> <p>2. Host must explicitly perform Erase operation to erase this entire register Table 99, “Register 0x04” [7:0] via Table 151, “Register 0x39”. The PMIC needs minimum of 100 ms for Erase operation.</p> <p>3. PMIC counts the error since last erase operation and if more than one error occurs, it sets this bit to ‘1’. Host must explicitly perform Erase operation to erase this entire register Table 99, “Register 0x04” [7:0].</p> <p>4. PMIC sets the bit when error occurs.</p> <p>Ex. |         | <div>Table 100 — Register 0x05</div> <table><tr><th colspan="4">R05</th></tr><tr><th>Bits</th><th>Attribute</th><th>Default</th><th>Description<sup>1,2</sup></th></tr><tr><td>2:0</td><td>ROE</td><td>0</td><td><div>R05 [2:0]: PMIC_ERROR_LOG<br/>PMIC Power On - High Level Status Bit to Previous Last Known Power Cycle<br/>000 = Normal Power On<br/>001 = Reserved<br/>010 = Buck Regulator Output Over or Under Voltage<sup>5</sup><br/>011 = Critical Temperature<br/>100 = VIN_Bulk Input Over Voltage<br/>101 = Reserved<br/>110 = Reserved<br/>111 = Reserved</div><div>at least three bits are written when Vin_Bulk overvoltage is detected</div></td></tr></table> <div><div>1. The PMIC always attempts to write this register into its non-volatile memory. However, it may not be guaranteed depending on how fast the host may shut off the input power to the PMIC. The PMIC needs minimum of 5.0V for VIN_Bulk voltage and 100 ms duration from PWR_GOOD signal assertion to guarantee the write operation into non-volatile memory.</div><div>2. This entire register status reflects previous power down cycle of the PMIC and is updated by the PMIC on its own at each power cycle, if update is needed. Because this register is updated only if there is an update needed, there is no NVM life time impact. This register is cleared when host issues the erase command via Table 151, “Register 0x39”. The PMIC needs minimum of 100 ms for Erase operation.</div><div>3. This register is set only if PMIC generates internal VR Disable command due to fault condition.</div></div> <div>Ex. CC-85 (JESD301-1) at 113 (annotated); Ex. CC-81 (JESD301-1A at 113); Ex. CC-83 (JESD301-4A) at 111, Table 91; Ex. CC-137 (JESD301-5) at 138, Table 111.</div> <div>Testing shows that various RDIMMs with Samsung PMIC, Renesas PMIC, TI PMIC, Rambus PMIC and MPS PMICs updated the 0x04 and 0x5 registers in the event of an input over-voltage condition, and these changes were retained after a power-down-and-reboot cycle, indicating that the contents in 0x04 and 0x05 registers had been successfully written to non-volatile memory.</div> <div>The below test setup shows a memory module, DIMM extender, and test connections to the various pins on</div> | R05     |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |  | Bits | Attribute | Default | Description <sup>1,2</sup> | 2:0 | ROE | 0 | <div>R05 [2:0]: PMIC_ERROR_LOG<br/>PMIC Power On - High Level Status Bit to Previous Last Known Power Cycle<br/>000 = Normal Power On<br/>001 = Reserved<br/>010 = Buck Regulator Output Over or Under Voltage<sup>5</sup><br/>011 = Critical Temperature<br/>100 = VIN_Bulk Input Over Voltage<br/>101 = Reserved<br/>110 = Reserved<br/>111 = Reserved</div> <div>at least three bits are written when Vin_Bulk overvoltage is detected</div> |

|         | <p>the DIMM (including VIN_BULK and VIN_MGMT, among others):</p>  A photograph showing a DIMM module (green circuit board with black chips) connected to various test wires. The wires are labeled with handwritten text on small white tags. Labels include: "GROUND" (multiple locations), "VDD", "VDDq", "VIN_BULK", "VIN_MGMT", "Vout: 1.8V", and "VIN_MGMT". The wires are connected to the DIMM module and other components, demonstrating the use of the DIMM in a test setup. |

|         | <p>As noted in Step 5, prior to the over-voltage event, the PMICs registers indicate that there are no error conditions. Step 7 confirms that the PMIC writes to the appropriate status registers following the input over-voltage condition. As noted in Steps 6-7 the error codes stored in the registers were able to be read via the I2C bus. This indicates that at least the I2C bus and the PMIC registers are powered on, which in turn, indicates that the memory module is in an operable state. Steps 8-11 confirm that the error codes written into the status registers maintain the same value upon disabling the power supply and re-powering, indicating that the error codes are stored in nonvolatile memory.</p> <p>The PMIC registers and bits referenced in the test procedure are noted in the following tables from JESD 301-1A:</p> |

| 2:0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | RV        | 00      | R32 [2:0]: Reserved                                                                                                                                                                                                                                 |
| <p>NOTE 1 Host sets this bit at first power on. After this bit is set, the PMIC executes Power On Sequence configuration 0 (Table 152, "Register 0x40") to Power On Sequence configuration 3 (Table 155, "Register 0x43") registers. At least one bit in Table 152, "Register 0x40" [6:3] must be set to '1' to issue VR Enable command.</p> <p>NOTE 2 The host shall ensure that prior to issuing VR Enable command, there is no pending IBI interrupt (i.e., Table 100, "Register 0x0A" [1] = '1') status. After host issues VR Enable command, the PMIC may NACK any I<sup>2</sup>C or I3C Basic bus transaction by host until tPMIC_PWR_GOOD_OUT timing parameter is satisfied. The host shall not access any device specific registers or issue any CCCs until tPMIC_PWR_GOOD_OUT parameter is satisfied. The PMIC device may request for an IBI during power up sequence (i.e., during tPMIC_PWR_GOOD_OUT time) if there is any event.</p> <p>NOTE 3 After host issues VR Enable command, the PMIC may NACK any I2C or I3C Basic bus transactions by host until tPMIC_PWR_GOOD_OUT timing parameter is satisfied.</p> <p>NOTE 4 Once Table 140, "Register 0x32" [7] is set to '1' via VR Enable command, the subsequent write to register Table 140, "Register 0x32" [5] = '0' is ignored by the PMIC. If there is a simultaneous write to register Table 140, "Register 0x32" [7,5] = '10', the PMIC prioritizes bit [5] and does not execute VR Enable command.</p> <p>NOTE 5 This register is automatically updated when SETAASA CCC or RSTDAAC CCC is registered by the PMIC device or when PMIC device goes through bus reset as described in clause 2.10.15 regardless of whether PMIC is in write protect mode or non write protect mode of operation. This register can be read by the Host through normal Read operation but it cannot be written with normal write operation either in I<sup>2</sup>C mode or I3C Basic mode of operation. When this register is updated, it takes in effect where there is a next START operation (i.e., after STOP operation).</p> <p>NOTE 6 When this encoding is set, the PMIC always floats the PWR_GOOD output signal even when there is an internal VR Disable command due to fault condition.</p> |           |         |                                                                                                                                                                                                                                                     |

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

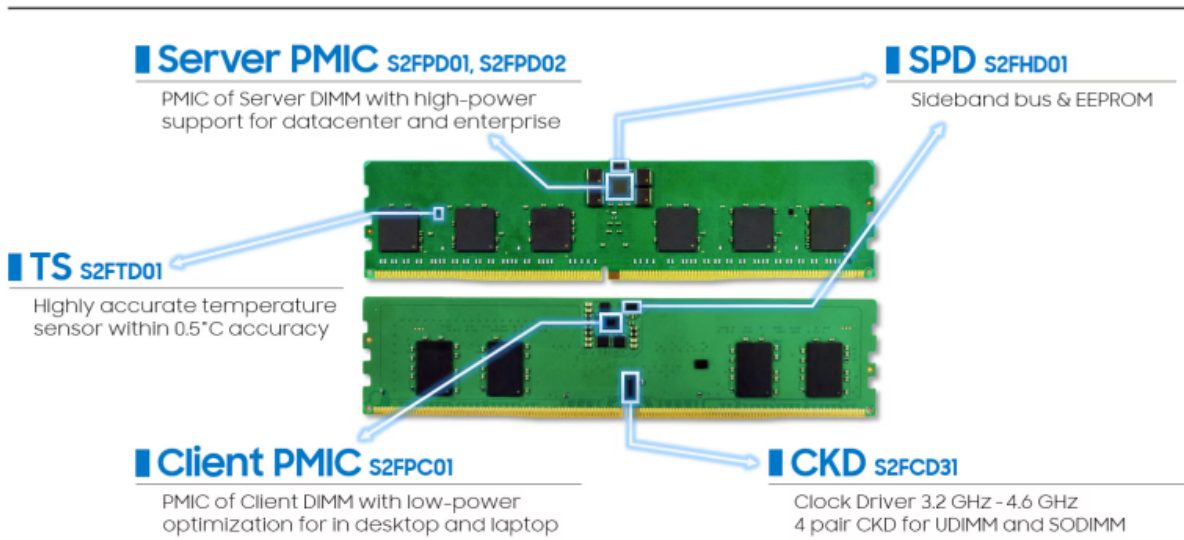

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>Ex. CC-25 at 159; <i>see also id.</i> at 112-113, 116, 118, 135, 163 (Tables 94, 95, 98, 100, 117, 146).</p> <p>Moreover, Netlist previously asserted claims 16, and 18–19 of U.S. Patent No. 11,016,918 against Samsung’s DDR5 DIMMs, which recites, among other limitations, “<b>a voltage monitor circuit</b> configured to monitor an input voltage received via a first portion of the plurality of edge connections, <b>the voltage monitor circuit configured to produce a [trigger] signal in response to the input voltage having a voltage amplitude that is greater than a first threshold voltage,</b>” “<b>a controller [which is the other portion of the controller in the 366 patent] coupled to the voltage monitor circuit and configured to receive the signal,</b> wherein <b>the controller executes a write operation in response to the [trigger] signal,</b>” and “wherein the write operation includes <b>writing data information into non-volatile memory.</b>” ’918 Patent, claims 16, 18–19 (emphases added). <i>See, e.g.,</i> Ex. CC-21 (EDTX Trial Tr. Day 2, 4 (2023)) at 333:9–12 (“Q. And can you tell us about claim 16 of the ’918 Patent? A. So here’s claim 16 of the ’918, and a claim analysis is just where I actually look at the claims and compare it to exactly how the products operate, the accused products.”), 381:24–25 (“Q: And what claim did you analyze next? A: Next, I turned to claim 18 . . . .”), 341:3 (“Q: Let’s turn to ’918, claim 19.”). Netlist previously asserted claim 16 of U.S. Patent No. 11,232,054 against Samsung’s DDR5 DIMMs, which requires among other things, “a controller coupled to the PCB, the controller including a voltage monitor circuit coupled to an input voltage received from the host system via the interface, the voltage monitor circuit configured to detect an amplitude change in the input voltage, wherein, in response to the voltage monitor detecting an amplitude change in the input voltage, the memory module transitions from a first operable state to a second operable state.” <i>Id.</i> at 345:12–13 (“Q: which claim did you analyze next? A: Next, I turned to claim 16 of the ’054 Patent.”).</p> <p>Samsung did not dispute these limitations. <i>Id.</i> at 885:24–886:9 (“With regard to the ’918 claims, I have determined that—that these claims are not infringed by the Samsung DDR5 product, at least for the reason that there is a limitation in each of the independent claims directed to the requirement of a converter circuit structure, and that is not found on any of these Samsung DDR5 products. And what’s being pointed to is a linear drop-out regulator, but that’s not a converter circuit. As relates to the ’054 claims, the DDR5 product has a normal operating state. The other state is it’s turned off. So it does not have a second operable state as required by the ’054 claims.”).</p> |

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1                                              | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>[1.c]</b> a set of components coupled to the PCB, | <p>The Accused Instrumentalities each include a set of components coupled to the PCB, such as DDR5 SDRAMs, RCD/MRCD (for RDIMMs and MRDIMMs), and data buffers (for MRDIMMs) as further explained in element 1d.2.</p> <p>Analysis below uses Samsung’s RDIMM format as an example, but MRDIMMs would operate in materially the same way in all relevant part. Ex. CC-13 (JEDEC Press Release) (JEDEC noting that other planned features for MRDIMMs include “Utilization of standard DDR5 DIMM components including DRAM, DIMM Form Factor &amp; Pinout, SPD, PMIC, and TS for ease of adoption”).</p> <p><i>See, e.g.</i>, Ex. CC-104 (Optimized DDR5 DIMM Solutions):</p> |

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

## Claim 1

## Evidence of Use

See also *id.* at 29, 25, 21; *id.* at 10 (showing SPD Hub, TS, D1-D20 (SDRAMs) and RCD as components coupled to the output of the PMIC):

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

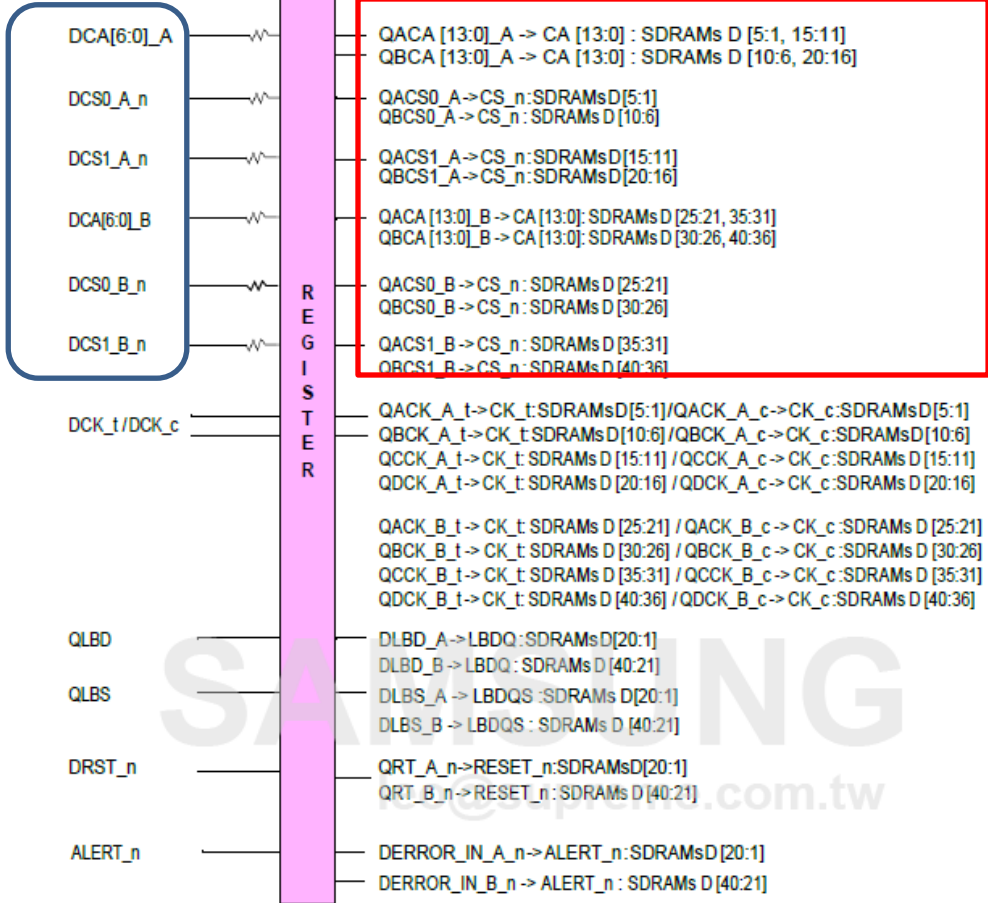

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>Moreover, Netlist previously asserted claim 16 of U.S. Patent No. 11,016,918 against Samsung's DDR5 DIMMs, which recites, among other limitations, "a plurality of components coupled to the PCB." <i>See, e.g.</i>, Ex. CC-21 (EDTX Trial Tr. Day 2, 4 (2023)) at 333:9–12 ("Q. And can you tell us about claim 16 of the '918 Patent? A. So here's claim 16 of the '918, and a claim analysis is just where I actually look at the claims and compare it to exactly how the products operate, the accused products.").</p> <p>Samsung did not dispute this limitation. <i>Id.</i> at 885:24–886:9 ("With regard to the '918 claims, I have determined that—that these claims are not infringed by the Samsung DDR5 product, at least for the reason that there is a limitation in each of the independent claims directed to the requirement of a converter circuit structure, and that is not found on any of these Samsung DDR5 products. And what's being pointed to is a linear drop-out regulator, but that's not a converter circuit. As relates to the '054 claims, the DDR5 product has a normal operating state. The other state is it's turned off. So it does not have a second operable state as required by the '054 claims.").</p> |

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

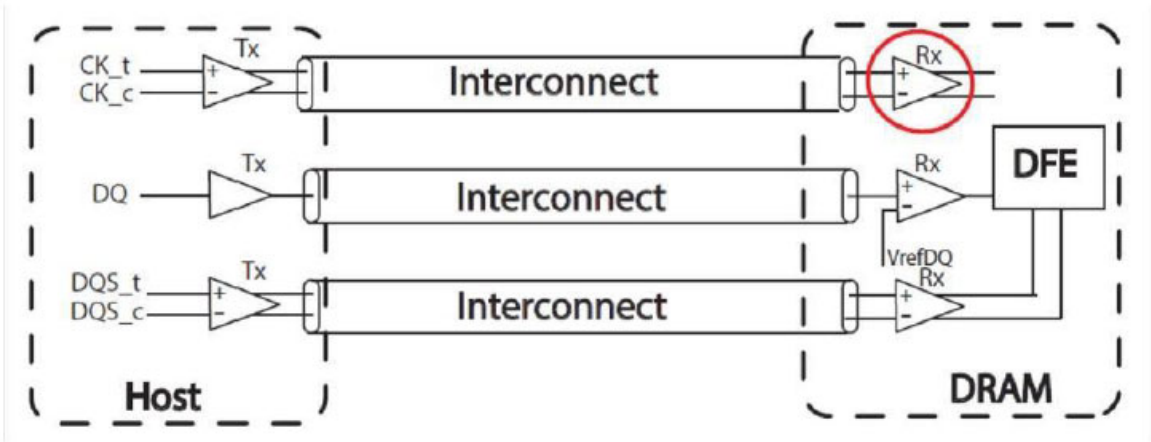

| Claim 1                                                                                                                                                                                                                            | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>[1.c.1]</b> the set of components including a plurality of double data rate (DDR) synchronous dynamic random access memory (SDRAM) devices coupled to the set of address and control lines and to the set of data lines,</p> | <p>The set of components coupled to the PCB includes a plurality of double data rate (DDR) synchronous dynamic random access memory (SDRAM) devices coupled to the set of address and control lines and to the set of data lines, <i>e.g.</i>, the DDR5 SDRAMs coupled to the C/A and data lines.</p> <p>Analysis below uses Samsung’s RDIMM format as an example, but MRDIMMs would operate in materially the same way in all relevant part. Ex. CC-13 (JEDEC Press Release) (JEDEC noting that other planned features for MRDIMMs include “Utilization of standard DDR5 DIMM components including DRAM, DIMM Form Factor &amp; Pinout, SPD, PMIC, and TS for ease of adoption”).</p> <p>For example, as shown in the Samsung DDR5 RDIMM Datasheet, there are 10 DDR5 DRAMs per rank for RDIMMs composed of x8 SDRAMs and 20 DRAMs per rank for RDIMMs composed of x4 SDRAMs. The SDRAMs are coupled to the C/A lines connected to the C/A edge connections, via the RCD. <i>See, e.g.</i>, Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 33:</p> |

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|         | <p>The diagram illustrates a memory array architecture. It features two main memory blocks, TS00 and TS01, each containing a 2x5 grid of data cells (D01-D10 for TS00, D21-D30 for TS01). These blocks are connected to a central RCD (Row Driver/Column Decoder) block. Below this, a second memory block is shown, containing a 2x5 grid of data cells (D11-D20 and D31-D40). This block is connected to a PMIC (Power Management IC) block. A legend indicates that blue lines represent Address, Control and Clock lines. The PMIC block is also connected to a SPD/HV block.</p> |

|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>Moreover, Netlist previously asserted claim 16 of U.S. Patent No. 11,016,918 against Samsung's DDR5 DIMMs, which recites, among other limitations, "a plurality of components coupled to the PCB, the plurality of components including a plurality of synchronous dynamic random access memory (SDRAM) devices." <i>See, e.g.,</i> Ex. CC-21 (EDTX Trial Tr. Day 2, 4 (2023)) at 333:9–12 ("Q. And can you tell us about claim 16 of the '918 Patent? A. So here's claim 16 of the '918, and a claim analysis is just where I actually look at the claims and compare it to exactly how the products operate, the accused products."). Netlist also asserted claim 1 of the '918 patent, which recites, among other limitations, "at least one circuit coupled between a first portion of the plurality of edge connections and the plurality of SDRAM devices, the at least one circuit operable to (i) receive a first plurality of address and control signals via the first portion of the plurality of edge connections, and (ii) output a second plurality of address and control signals to the plurality of SDRAM devices, . . . ." <i>Id.</i> at 342:8–9 ("Next, I turned to claim 1 of the '918. Now, as we'll see, claim 1 only applies to the RDIMM products.").</p> <p>Samsung did not dispute this limitation. <i>Id.</i> at 885:24–886:9 ("With regard to the '918 claims, I have determined that—that these claims are not infringed by the Samsung DDR5 product, at least for the reason that there is a limitation in each of the independent claims directed to the requirement of a converter circuit structure, and that is not found on any of these Samsung DDR5 products. And what's being pointed to is a linear drop-out regulator, but that's not a converter circuit. As relates to the '054 claims, the DDR5 product has a normal operating state. The other state is it's turned off. So it does not have a second operable state as required by the '054 claims.").</p> |

|--------------------------|------------------|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DQ[31:0]_A<br>DQ[31:0]_B | Input/<br>Output | VDD | Data Input/ Output: Bi-directional data bus. If CRC is enabled via Mode register then CRC code is added at the end of Data Burst. Any DQ from DQ0-DQ3 may indicate the internal Vref level during test via Mode Register Setting MR4 A4=High. Refer to vendor specific data sheets to determine which DQ is used. |
| CB[7:0]_A<br>CB[7:0]_B   | Input/<br>Output | VDD | ECC Check Bits Input/ Output: Bi-directional data bus.                                                                                                                                                                                                                                                            |

The input and output of the data by SDRAMs are in response to C/A signals input to the SDRAMs. For example, as illustrated below, one input to the SDRAM is chip select (CS) signals. Ex. CC-89 (Samsung DDR5 RDIMM datasheet) at 34–35:

|                                                                                                                                                                                                                                | CS[1:0]_A<br>CS[1:0]_B | Input | VDD        | Chip Select : All commands are masked when CS_n is registered HIGH. CS_n provides for external Rank selection on systems with multiple Ranks. CS_n is considered part of the command code. CS_n is also used to enter and exit the parts from power down mode and self refresh mode. While not in self refresh mode the CS_n input buffer operates with the same ODT and VREF parameters as configured by the CA_ODT strap setting or mode register. When in self refresh the CS_n is a CMOS rail to rail signal with DC high and low at 80% and 20% of VDD. |
|                                                                                                                                                                                                                                | PAR_A<br>PAR_B         | Input | VDD        | Command and Address Parity Input: DDR5 Supports Even Parity check in DRAMs with MR setting. Once it's enabled via Register in MR5, then DRAM calculates Parity. Input parity should be maintained at the rising edge of the clock and at the same time with command & address with CSx_x_n LOW                                                                                                                                                                                                                                                               |
| <p>The data signals are input and output by the SDRAMs in accordance with so-called command truth table, which shows that read and write operations are indicated by specific combinations of command and address signals:</p> |                        |       |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

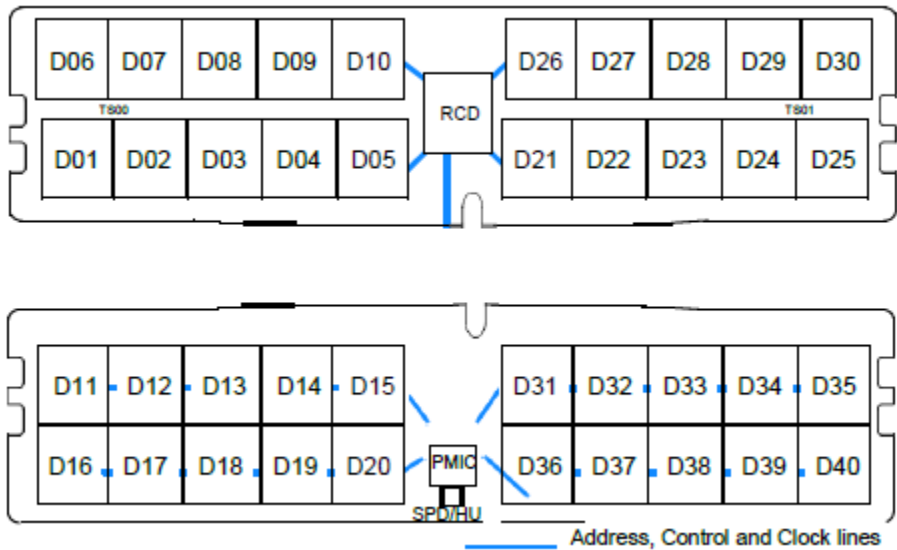

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                                                                                                                                                                                                                                                                         | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>[1.d] first, second, third, and fourth converter circuits coupled to the PCB and to the input voltage supply line, and configured to receive power from the input voltage supply line and to deliver power via first, second, third, and fourth regulated voltage lines,</p> | <p>In each of Samsung's DDR5 DIMMs, there are multiple buck converters and LDOs contained in a PMIC coupled to the PCB. Analysis below uses Samsung's RDIMM format as an example, but MRDIMMs would operate in materially the same way in all relevant part. Ex. CC-13 (JEDEC Press Release) (JEDEC noting that other planned features for MRDIMMs include "Utilization of standard DDR5 DIMM components including DRAM, DIMM Form Factor &amp; Pinout, SPD, PMIC, and TS for ease of adoption").</p>  <p><i>E.g.</i>, Ex. CC-89 (Samsung DDR5 RDIMM datasheet) at 33, 29, 25, 21.</p> <p>For example, as noted above, each of Samsung's DDR5 DIMMs includes a PMIC, which in turn includes at least four voltage regulators or converters. <i>See, e.g.</i>, Ex. CC-104 (Optimized DDR5 DIMM Solutions) (annotated):</p> |

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |                                                                                              |     |                                                                                              |     |                                                                                              |      |                                                                             |      |                                                                                 |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------------------------------------------------------------------------|-----|----------------------------------------------------------------------------------------------|-----|----------------------------------------------------------------------------------------------|------|-----------------------------------------------------------------------------|------|---------------------------------------------------------------------------------|
|         | <p>As PMICs have evolved, the number and type of power channels has increased accordingly, with server products generally requiring more channels and higher power capacity than client products. This is why server products use a 4-channel buck converter and a dual low-dropout regulator (2LDO)<sup>1</sup> — and client products use a 3-channel buck converter and 2LDO.<sup>2</sup> Initial plans were to have only one product each for servers and clients, but as DRAM modules increased in capacity and speed, it became clear that necessary power would have to be supplied in different ways, leading to the diversification of products.</p> <p><sup>1</sup>) Server Models: PMIC5000 5010 5020 5030.</p> <p><sup>2</sup>) Client Models: PMIC 5100 5120 5200.</p> <p>In DDR5 RDIMMs and MRDIMMs, the VDD voltage supplied to the SDRAMs is provided a combination of <i>e.g.</i>, two buck converters (SWA and SWB), which together forms a dual-phase buck converter. The SWC and SWD buck converters each operate as a single-phase buck converter. The two LDOs also each serve as a voltage converter circuit. Thus, for example, SWA+SWB, SWC, SWD and LD0_1.0V can be the claimed first, second, third and fourth converter circuits.</p> <p><i>See also, e.g., Ex. CC-139 (S2FPC01 Brochure) at 2:</i></p> <table border="1" data-bbox="562 1114 1873 1416"> <tbody> <tr> <td data-bbox="562 1114 999 1174">SWA+SWB</td><td data-bbox="999 1114 1873 1174">Programmable output with 5mV step (0.6V ~ 1.435V)<br/>Switching Frequency : 0.5MHz to 1.25MHz</td></tr> <tr> <td data-bbox="562 1174 999 1234">SWC</td><td data-bbox="999 1174 1873 1234">Programmable output with 5mV step (0.6V ~ 1.435V)<br/>Switching Frequency : 0.5MHz to 1.25MHz</td></tr> <tr> <td data-bbox="562 1234 999 1294">SWD</td><td data-bbox="999 1234 1873 1294">Programmable output with 5mV step (1.5V ~ 2.835V)<br/>Switching Frequency : 0.5MHz to 1.25MHz</td></tr> <tr> <td data-bbox="562 1294 999 1354">LD01</td><td data-bbox="999 1294 1873 1354">Programmable output voltage 1.7/1.8/1.9V<br/>Output current capacity of 25mA</td></tr> <tr> <td data-bbox="562 1354 999 1416">LD02</td><td data-bbox="999 1354 1873 1416">Programmable output voltage 0.9/1.0/1.1/1.2V<br/>Output current capacity of 20mA</td></tr> </tbody> </table> | SWA+SWB | Programmable output with 5mV step (0.6V ~ 1.435V)<br>Switching Frequency : 0.5MHz to 1.25MHz | SWC | Programmable output with 5mV step (0.6V ~ 1.435V)<br>Switching Frequency : 0.5MHz to 1.25MHz | SWD | Programmable output with 5mV step (1.5V ~ 2.835V)<br>Switching Frequency : 0.5MHz to 1.25MHz | LD01 | Programmable output voltage 1.7/1.8/1.9V<br>Output current capacity of 25mA | LD02 | Programmable output voltage 0.9/1.0/1.1/1.2V<br>Output current capacity of 20mA |

CC-26 (TPS53832 Data Sheet).</p> <p>Additionally, as noted above, the PMICs used in Samsung's DDR5 DIMMs allegedly comply with the appropriate JEDEC standards:</p> |

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>As PMICs have evolved, the number and type of power channels has increased accordingly, with server products generally requiring more channels and higher power capacity than client products. This is why server products use a 4-channel buck converter and a dual low-dropout regulator (2LDO)<sup>1</sup> — and client products use a 3-channel buck converter and 2LDO.<sup>2</sup> Initial plans were to have only one product each for servers and clients, but as DRAM modules increased in capacity and speed, it became clear that necessary power would have to be supplied in different ways, leading to the diversification of products.</p> <p><sup>1</sup>) Server Models: PMIC5000 5010 5020 5030.</p> <p><sup>2</sup>) Client Models: PMIC 5100 5120 5200.</p> <p>Ex. CC-104 (Optimized DDR5 DIMM Solutions).</p> <p>According to the JEDEC PMIC standards, PMICs for server applications have four buck converters and two LDOs for external output, and SWA and SWB can be combined to form a dual phase buck converter.</p> <p>The four converter circuits are coupled to the one or more input voltage supply lines, and configured to receive power from the input voltage supply lines and to deliver power via first, second, third, and fourth regulated voltage lines. <i>See, e.g.</i>, Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 10 (showing the PMIC receiving power input from VIN_BULK and VIN_MGMT lines and outputting various regulated voltages to associated components). For instance, when VIN_MGMT is operating normally, VDD, VDDQ and VPP are generated from VIN_BULK while VDDIO (1.0V) and VDDSPD (1.8V) are generated from VIN_MGMT. However, when VIN_MGMT drops below a threshold, VDDIO and VDDSPD are generated from the 12V VIN_BULK in a switch-over event.</p> |

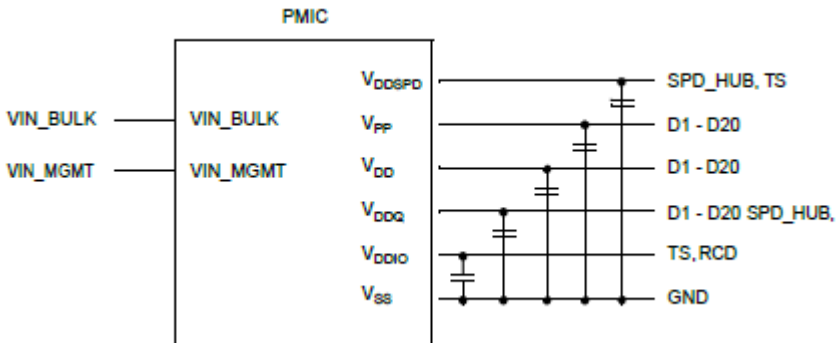

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>amplitudes, respectively.” <i>See, e.g.</i>, Ex. CC-21 (EDTX Trial Tr. Day 2, 4 (2023)) at 333:9–12 (“Q. And can you tell us about claim 16 of the ’918 Patent? A. So here’s claim 16 of the ’918, and a claim analysis is just where I actually look at the claims and compare it to exactly how the products operate, the accused products.”). Netlist also asserted claim 1 of the ’918 patent, which recites, among other limitations, “a first buck converter configured to provide a first regulated voltage having a first voltage amplitude; a second buck converter configured to provide a second regulated voltage having a second voltage amplitude; a third buck converter configured to provide a third regulated voltage having a third voltage amplitude; a converter circuit configured to provide a fourth regulated voltage having a fourth voltage amplitude.” <i>Id.</i> at 342:8–9 (“Next, I turned to claim 1 of the ’918. Now, as we’ll see, claim 1 only applies to the RDIMM products.”).</p> <p>Samsung only disputed whether an LDO is a claimed converter circuit. <i>Id.</i> at 885:24–886:9 (“With regard to the ’918 claims, I have determined that—that these claims are not infringed by the Samsung DDR5 product, at least for the reason that there is a limitation in each of the independent claims directed to the requirement of a converter circuit structure, and that is not found on any of these Samsung DDR5 products. And what’s being pointed to is a linear drop-out regulator, but that’s not a converter circuit. As relates to the ’054 claims, the DDR5 product has a normal operating state. The other state is it’s turned off. So it does not have a second operable state as required by the ’054 claims.”).</p> |

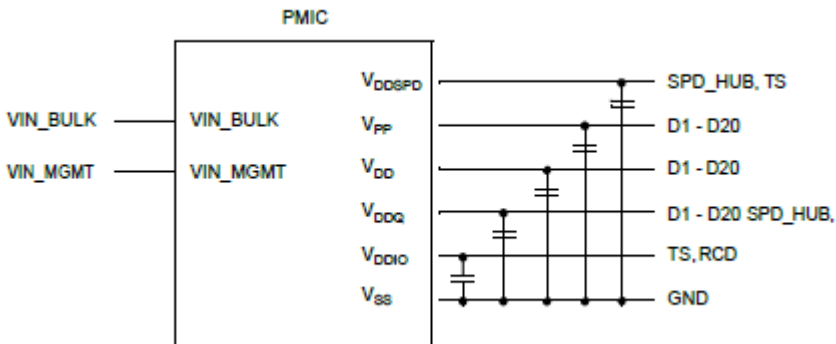

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>[1.d.1]</b> wherein the set of components includes:<br/> a first component configured to receive power via at least the first regulated voltage line;<br/> a second component configured to receive power via at least the second regulated voltage line;<br/> a third component configured to receive power via at least the third regulated voltage line; and<br/> a fourth component configured to receive power via at least the fourth regulated voltage line;</p> | <p>In each of Samsung's DDR5 DIMMs, the set of components includes:</p> <ul style="list-style-type: none"> <li>• a first component configured to receive power via at least the first regulated voltage line;</li> <li>• a second component configured to receive power via at least the second regulated voltage line;</li> <li>• a third component configured to receive power via at least the third regulated voltage line; and</li> <li>• a fourth component configured to receive power via at least the fourth regulated voltage line.</li> </ul> <p>For example, as shown by Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 10, any of SDRAMs D1-D20 are designed to receive VDD, VPP and VDDQ output by the buck converters; and RCD is designed to receive 1.0V VDDIO from 1.0V LDO and although not shown, also VDDQ (*).</p>  <p>*As noted above, although not shown, RCD also receives a 1.1V voltage. This would be understood as for I/O communication with SDRAM for C/A signal transmissions. The 1.0V VDDIO is for operating the sideband bus (I2C/I3C). For example, Rambus, one DDR5 RCD supplier to Samsung states on its website that one feature of the DDR5 RCD is “Low Power 1.1V VDD.” See Ex. CC-96 (Rambus DDR5 RCD). Likewise, Montage, another DDR5 RCD supplier to Samsung, shows that its RCDs</p> |

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>receive “1.1V VDD and 1.0V VDDIO voltages.” Ex. CC-48 (Montage M88DR5RCD01 (Gen1 DDR5 RCD)); Ex. CC-87 (Montage M88DR5RCD02 (Gen2 DDR5 RCD)); Ex. CC-97 (Montage M88DR5RCD03 (Gen3 DDR5 RCD)); Ex. CC-98 (Montage M88DR5RCD04 (Gen4 DDR5 RCD)).</p> <p>*On the other hand, SPD—being required to be on before the buck converters are ready to operate and generate the 1.1V VDDQ power output—should not be required to operate off the VDDQ voltage rail. And this is confirmed by SPD suppliers’ web sites. For example, Montage shows that its SPD_Hub operates off “1.8 V VDDSPD and 1.0 V VDDIO power supply.” Ex. CC-140 (Montage M88SPD5118 (DDR5 SPD Hub)). Likewise, Renesas’s SPD5118 block diagram shows only input of VDDSPD and VIO, but nothing about VDDQ (or VDD). <i>See</i> Ex. CC-141 (Renesas SPD5118 – SPD HUB for DDR5):</p> <div data-bbox="911 740 1541 1172" data-label="Diagram"> <pre> graph LR     VDDSPD --&gt; Hub     VIO --&gt; Hub     Hub --&gt; LSDA     Hub --&gt; LSCL     Hub &lt;--&gt; HSDA     Hub &lt;--&gt; HSCL     Hub --- LDO     Hub --- TempSensor[Temperature Sensor]     Hub --- EEPROM     Hub --- HSA_Sense[HSA Sense]     HSA_Sense --&gt; HSA[HSA I3C/I2C Address Pin]     GND --&gt; Hub     </pre> </div> <p>Thus, it is believed that in the figure below, VDDQ is to be supplied to D1-D20 and RCD, not D1-D20 and SPD.</p> |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                        | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |            |                   |                                |       |                            |     |                           |     |                            |      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-------------------|--------------------------------|-------|----------------------------|-----|---------------------------|-----|----------------------------|------|
|                                |  <p>The diagram shows a PMIC block with inputs VIN_BULK and VIN_MGMT. On the right, it lists output rails: VDDSPD, VPP, VDD, VDDQ, VDDIO, and VSS. These rails are connected to various components: VDDSPD to SPD_HUB, TS; VPP to D1 - D20; VDD to D1 - D20; VDDQ to D1 - D20 SPD_HUB,; VDDIO to TS, RCD; and VSS to GND. Capacitors are shown at several output nodes.</p> <p>Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 10.</p> <p>In Samsung MRDIMMs, the voltage rails for the SDRAMs would be the same because the same DDR5 SDRAMs are used. Ex. CC-13 (JEDEC Press Release) (one planned feature for MRDIMM is “Utilization of standard DDR5 DIMM components including DRAM, DIMM Form Factor &amp; Pinout, SPD, PMIC, and TS for ease of adoption”). Samsung’s MRDIMMs also use Montage’s MRCD01. <i>See</i> images of Samsung MRDIMM in 1pre. Montage states that MRCD receives a 1.1V VDD and a 1.0V VDDIO input. <i>See</i> Ex. CC-12 (Montage M88MR5RCD01 (Gen 1 DDR5 MRCD)). Because the 1.1V is to support I/O communication with host and DRAM, it is more likely that the 1.1V is connected to the VDDQ rail than the VDD rail. But that would not affect the analysis.</p> <p>A combination that would satisfy this limitation and the next limitation is a combination of three SDRAMs and an RCD, with the three SDRAMs receiving respectively VDD, VDDQ and VPP and the RCD receiving VDDIO. Some specific combinations are as below:</p> <table border="1"> <thead> <tr> <th>Components</th><th>Regulated Voltage</th></tr> </thead> <tbody> <tr> <td>First Component: RCD (or MRCD)</td><td>VDDIO</td></tr> <tr> <td>Second Component: D1 SDRAM</td><td>VDD</td></tr> <tr> <td>Third Component: D2 SDRAM</td><td>VPP</td></tr> <tr> <td>Fourth Component: D3 SDRAM</td><td>VDDQ</td></tr> </tbody> </table> | Components | Regulated Voltage | First Component: RCD (or MRCD) | VDDIO | Second Component: D1 SDRAM | VDD | Third Component: D2 SDRAM | VPP | Fourth Component: D3 SDRAM | VDDQ |

| SDRAMs                                                                                                                                                                                                                                                                                                 | VDD, VDDQ, VPP                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |            |                   |                          |                |        |                |

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1                                                                                                                                                                                                                                                                                                                                                                                                                           | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>[1.e]</b> wherein the plurality of DDR SDRAM devices includes:</p> <p>a first group of at least five DDR SDRAM devices that are each connected to a first chip select line configured to electrically conduct a first chip select signal;</p> <p>a second group of at least four DDR SDRAM devices that are each connected to a second chip select line configured to electrically conduct a second chip select signal;</p> | <p>The plurality of DDR SDRAM devices includes a first group of at least five DDR SDRAM devices that are each connected to a first chip select line configured to electrically conduct a first chip select signal (<i>e.g.</i>, those SDRAMs in channel A, rank 0 or channel A, rank 1) and a second group of at least four DDR SDRAM devices that are each connected to a second chip select line configured to electrically conduct a second chip select signal (<i>e.g.</i>, those SDRAMs in channel B, rank 0 or channel B, rank 1). For example, an ECC DIMM would include five x8 SDRAMs and ten x4 SDRAMs in each rank associated with each of channels A and B.</p> <p>Analysis below uses Samsung’s RDIMM format as an example, but MRDIMMs would operate in materially the same way in all relevant part. Ex. CC-13 (JEDEC Press Release) (JEDEC noting that other planned features for MRDIMMs include “Utilization of standard DDR5 DIMM components including DRAM, DIMM Form Factor &amp; Pinout, SPD, PMIC, and TS for ease of adoption”).</p> <p><i>E.g.</i>, Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 33–35 (annotated):</p> |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|         | <p><b>Channel A</b></p> <p>The diagram illustrates the internal structure of Channel A, organized into two main sections. Each section contains five rows of data storage elements, labeled D01 through D05 on the left and D11 through D15 on the right, and D06 through D10 on the left and D16 through D20 on the right. Each storage element is represented by a square block with internal labels 'CS' and 'Q'. The word lines (QACS0_A_n, QACS1_A_n, QBCS0_A_n, QBCS1_A_n) are connected to the top of each element. The bit lines (ZQ) are connected to the right side of each element, which is then connected to VSS. The data inputs/outputs are labeled with DQS (data strobe), DQS_c (data strobe complement), and DQ (data) with specific address ranges. For example, D01 is connected to DQS00_t, DQS00_c, and DQ [03:00]. D11 is connected to DQS_t, DQS_c, and DQ [3:0]. D06 is connected to DQS05_t, DQS05_c, and DQ [07:04]. D16 is connected to DQS_t, DQS_c, and DQ [3:0]. D09 is connected to DQS08_t, DQS08_c, and DQ [31:28]. D19 is connected to DQS_t, DQS_c, and DQ [3:0]. D10 is connected to DQS09_t, DQS09_c, and DQ [3:0]. D20 is connected to DQS_t, DQS_c, and DQ [3:0].</p> |

|         | <p><b>Channel B</b></p> <p>The diagram illustrates the internal structure of Channel B, showing 20 data buffers (D01-D20) organized into two columns. Each buffer is connected to a common data bus (DQ [3:0]) and has its own DQS_t and DQS_c inputs. The ZQ output of each buffer is connected to VSS. The buffers are grouped by address ranges: D01-D05 (03:00), D06-D10 (07:04), D11-D15 (11:08), and D16-D20 (15:12). The diagram also shows the connection of the DQS_t and DQS_c signals to the buffers.</p> <p><i>E.g., Ex. CC-89 (Samsung DDR5 RDIMM Datasheet) at 25–27 (annotated):</i></p> |

## Channel B

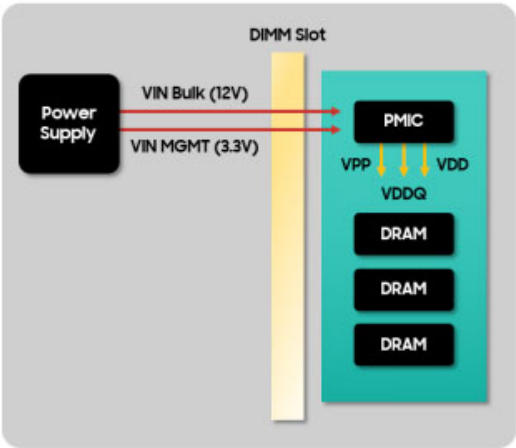

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p><i>See also, e.g., id.</i> at 21–23, 29–31. As seen above, there are separate and independent C/A and CS signals for SDRAMs in channel A (DCA[6:0]_A and DCS0_A_n, DCS1_A_n) and SDRAMs in channel B (DCA[6:0]_B and DCS0_B_n, DCS1_B_n). The first group of SDRAMs are therefore each connected to a first chip select line (signal line connected to DCS0_A_n or DCS1_A_n) configured to electrically conduct a first chip select signal (DCS0_A_n or DCS1_A_n). The second group of SDRAMs are therefore each connected to a second chip select line (signal line connected to DCS0_B_n or DCS1_B_n) configured to electrically conduct a first chip select signal (DCS0_B_n or DCS1_B_n).</p> |

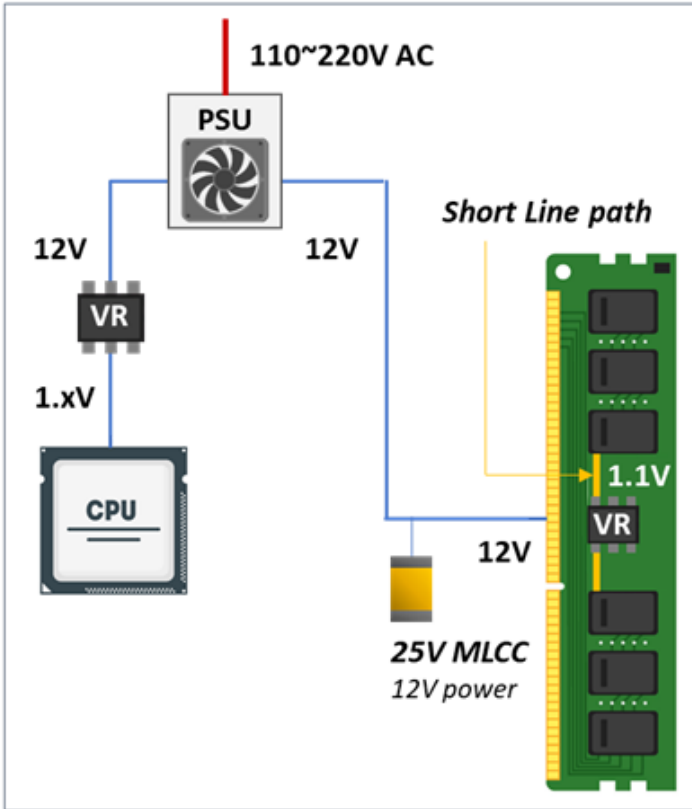

**U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)**

| Claim 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>[1.e.1]</b> wherein when power from the power rails of the system board is provided to the DIMM and each group of the first and second groups of DDR SDRAM devices is not in self-refresh mode:</p> <p>the first group of DDR SDRAM devices is configured to be enabled, in response to the first chip select signal, to receive or output at least 40 1-bit DDR data signals in parallel via at least 40 data lines of the set of data lines independently of whether the second group of DDR SDRAM devices is enabled, in response to the second chip select signal, to receive or output an integer number of 1-bit DDR data signals in parallel via the integer number of data lines of the set of data lines;</p> | <p>Analysis below primarily uses Samsung’s RDIMM format as an example, but MRDIMMs would operate in materially the same way in all relevant part. Ex. CC-13 (JEDEC Press Release) (JEDEC noting that other planned features for MRDIMMs include “Utilization of standard DDR5 DIMM components including DRAM, DIMM Form Factor &amp; Pinout, SPD, PMIC, and TS for ease of adoption”).</p> <p>Samsung’s DDR5 DIMMs are designed to input or output data when it receives power from the power rails of the system board and each group of the first and second groups of DDR SDRAM devices is not in self-refresh mode. For example, as shown in Ex. CC-104 (Optimized DDR5 DIMM Solutions), DRAMs require VPP, VDDQ and VDD generated in response to power from the power rails of the system board via the DIMM slot:</p> |

## U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1                                                                                                                                                                  | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>the at least 40 1-bit DDR data signals include at least 32 1-bit wide DDR data signals and at least eight 1-bit DDR error-correcting code (ECC) data signals; and</p> | <div style="text-align: center;">  <p>The diagram, titled "DDR5 DIMM", illustrates the power architecture. A "Power Supply" block on the left is connected to a "DIMM Slot" (represented by a yellow vertical bar) via two red lines labeled "VIN Bulk (12V)" and "VIN MGMT (3.3V)". The "DIMM Slot" is connected to a teal-colored board containing a "PMIC" (Power Management IC) and three "DRAM" modules. The PMIC is connected to the DIMM Slot and provides power to the DRAM modules via three yellow lines labeled "VPP", "VDDQ", and "VDD".</p> </div> <p><i>See also</i> Ex. CC-120 (Samsung, “Memory VR changes in the system by DDR5 adoption”) (the off-DIMM 12V line is an example of power rails of the system board, which would then be fed to the DIMM slot and from the DIMM slot to the power pins of the DIMM’s edge connections).</p> |

U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

If CRC is enabled via Mode register then CRC code is added at the end of Data Burst. Any DQ from DQ0-DQ3 may indicate the internal Vref level during test via Mode Register Setting MR4 A4=High. Refer to vendor specific data sheets to determine which DQ is used. |     |                                                                                                                                                                                                                                                                                                                   |                        |                  |     |                                                        |
| CB[7:0]_A<br>CB[7:0]_B   | Input/<br>Output                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | VDD                      | ECC Check Bits Input/ Output: Bi-directional data bus.                                                                                                                                                                                                                                                            |     |                                                                                                                                                                                                                                                                                                                   |                        |                  |     |                                                        |

# U.S. Patent No. 12,373,366 Domestic Industry Claim Chart (Samsung)

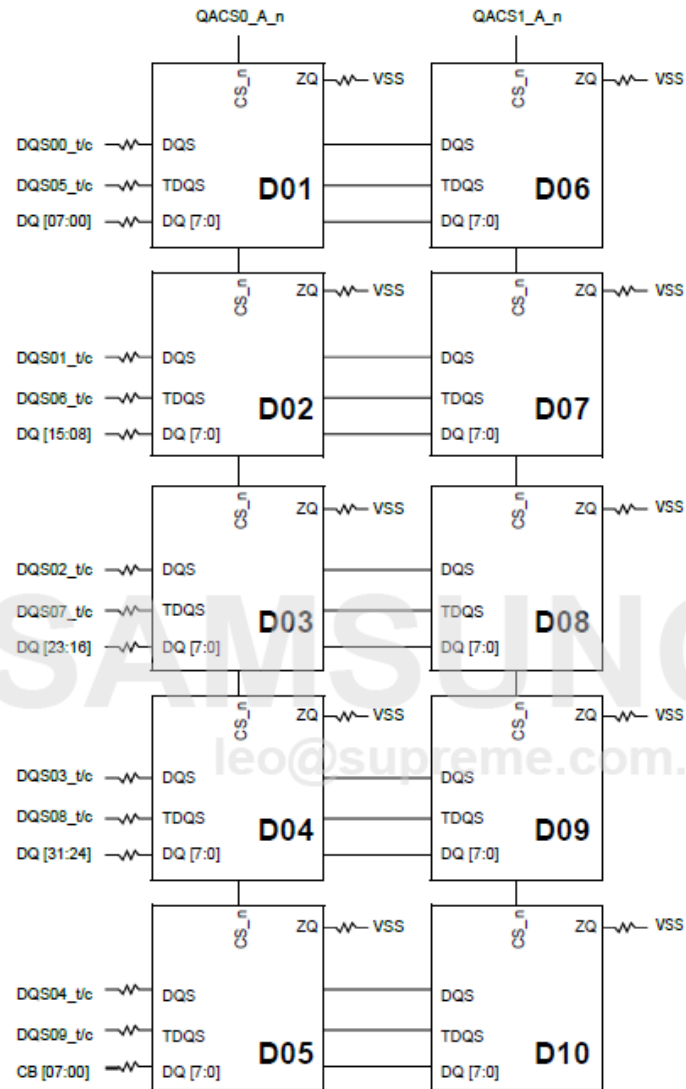

| Claim 1 | Evidence of Use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|         | <p><b>Channel A</b></p> <p>The diagram illustrates the internal structure of Channel A, organized into two main sections. Each section contains five rows of data path blocks. The left section, connected to QACS0_A_n and QACS1_A_n, includes blocks D01-D05 and D11-D15. The right section, connected to QBCS0_A_n and QBCS1_A_n, includes blocks D06-D10 and D16-D20. Each block (D01-D20) is a square component with a capacitor symbol (C<sub>S</sub>) and a ZQ input connected to VSS. The blocks are interconnected via DQS (data strobe) and DQ (data) lines. For example, DQS00_t, DQS00_c, and DQ [03:00] are inputs to D01, which is connected to D11. Similarly, DQS05_t, DQS05_c, and DQ [07:04] are inputs to D06, which is connected to D16. The diagram shows a complex interconnection of these data paths across the two sections.</p> |

Claim 1

Evidence of Use

Ex. CC-73 (JEDEC PS-005B) at 13, Figs. 6 and 7 (annotated) (showing an electrical connection between a connector in a memory slot and a corresponding edge connection of the DIMM).

Thus, the sum of the data lines equals a total number of data conduits of the set of data conduits of the memory slot connector, and given that there are 80 data lines per EC8 DDR5 DIMM, that total number of data conduits (80) is at least 72 data conduits.
