

EXHIBIT 19

EXHIBIT A1

U.S. Patent No. 8,330,235 Infringement Chart

Claim	Tower '235 Accused Products
[1pre] A semiconductor device comprising:	To the extent the preamble is limiting, devices manufactured by Tower that rely on its RF and power management processes (including its 65nm RF process) (hereinafter, "Tower '235 Accused Products") comprise a semiconductor device. For example, the Tower '235 Accused Products include the Qorvo QM81026 chip.¹ That is, on information and belief, the QM81026 has substantially similar structure, function, operation, and implementation with respect to the claims of the '235 patent as any other Tower '235 Accused Products.

¹ GlobalFoundries reserves the right to identify to identify different or additional Tower '235 Accused Products and amend or supplement these charts after further investigation and discovery, claim construction, or other meriting circumstances. Such supplemental information may include, but is not limited to, source code, data sheets, design specifications, deposition testimony, testing information, reference designs implementation and utilization information, and/or schematics.

EXHIBIT A1

Claim	Tower '235 Accused Products
	

EXHIBIT A1

Claim	Tower '235 Accused Products
	GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm the Tower '235 Accused Products comprise a semiconductor device. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[1a] a silicon substrate,	The Tower '235 Accused Products comprise a silicon substrate. For example, the reverse engineering analysis below shows a representative cross-section of the Tower '235 Accused Products, which shows a silicon substrate (bottom). GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm the Tower '235 Accused Products comprise a silicon substrate.

EXHIBIT A1

Claim	Tower '235 Accused Products
	To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[1b] a transistor, comprising source/drain regions and a gate electrode, on the substrate; and	The Tower '235 Accused Products comprise a transistor, comprising source/drain regions and a gate electrode, on the substrate. For example, the transistors in Tower '235 Accused Products each include source/drain regions and a gate electrode. GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm the Tower '235 Accused Products comprise a transistor, comprising source/drain regions and a gate electrode, on the substrate. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially

EXHIBIT A1

Claim	Tower '235 Accused Products
	the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[1c] a nickel silicide layer on the gate electrode and source/drain regions,	The Tower '235 Accused Products comprise a nickel silicide layer on the gate electrode and source/drain regions. For example, the Tower '235 Accused Products include a nickel silicide layer on the gate electrode and source/drain regions. The reverse engineering analyses below show the presence of a nickel silicide layer on representative examples of the electrodes. 

EXHIBIT A1

Claim	Tower '235 Accused Products
	GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm the Tower '235 Accused Products comprise a nickel silicide layer on the gate electrode and source/drain regions. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[1d] wherein the nickel silicide layer comprises platinum having a composition gradient, from a nickel silicide surface at a silicon interface to an opposite surface of the nickel silicide, with platinum increasing in amount in a direction away from the source/drain regions and the gate electrode, from between about 8 wt. % and about 12 wt. % at the silicon interface.	For example, the Tower '235 Accused Products include a nickel silicide layer comprising platinum that increases in a direction away from the source/drain regions and the gate electrode (i.e., in an upward direction in the reverse engineering analyses below) from between about 8 wt. % and about 12 wt. % at the silicon interface. The reverse engineering analysis below shows the platinum composition gradient in the nickel silicide layer. The green arrow in the image below corresponds to the green arrow in the following two figures (i.e., such that the

EXHIBIT A1

Claim	Tower '235 Accused Products
nickel silicide, with platinum increasing in amount in a direction away from the source/drain regions and the gate electrode, from between about 8 wt. % and about 12 wt. % at the silicon interface.	upward direction in the image below corresponds to the right-to-left direction in the following two materials analysis charts).  As shown below, the platinum concentration increases from between about 8 wt. % and 12 wt. % in an upward direction (i.e., right-to-left) in the image below.

EXHIBIT A1

Claim	Tower '235 Accused Products
	 This graph shows the weight fraction (%) of various elements as a function of position (nm) from 0 to 50 nm. The y-axis ranges from 0 to 80%. A green arrow at the top points left, indicating the direction of analysis. The legend includes N (green), O (blue), Si (cyan), Ti (magenta), Ni (yellow), W (white), and Pt (pink). The Si signal starts at ~75% at 0 nm and drops to 0 by ~10 nm. The Ti signal peaks at ~45% around 15 nm. The Ni signal peaks at ~45% around 25 nm. The Pt signal peaks at ~20% around 20 nm. The W signal is low and broad, peaking around 20 nm. The O signal is very low throughout.  This graph shows the weight fraction (%) of various elements as a function of position (nm) from 0 to 50 nm. The y-axis ranges from 0 to 20%. A green arrow at the top points left, indicating the direction of analysis. The legend includes N (green), O (blue), Si (cyan), Ti (magenta), Ni (yellow), W (white), and Pt (pink). The Si signal starts at ~20% at 0 nm and drops to 0 by ~10 nm. The Ti signal peaks at ~20% around 15 nm. The Ni signal peaks at ~20% around 25 nm. The Pt signal peaks at ~20% around 20 nm. The W signal is low and broad, peaking around 20 nm. The O signal is very low throughout. Likewise, the reverse engineering analysis below show the platinum composition gradient in the nickel silicide layer. Again, the green arrow in the reverse engineering analysis below corresponds to the green arrow in the

EXHIBIT A1

Claim	Tower '235 Accused Products
	following two material analysis charts (i.e., such that the upward direction in the reverse engineering analysis immediately below corresponds to the right-to-left direction in the following two material analysis charts). The platinum concentration increases from between about 8 wt. % and 12 wt. % at the silicon interface.  The chart displays the weight fraction (%) of several elements as a function of position (nm). The y-axis ranges from 0 to 80, and the x-axis ranges from 0 to 50 nm. A green arrow at the top points from right to left, indicating the direction of analysis. The legend identifies the following elements: N (green), O (blue), Si (cyan), Ti (magenta), Ni (yellow), W (white), and Pt (pink). The Si concentration (cyan line) starts at 0% at 0 nm, rises to about 85% at 45 nm, and then slightly decreases. The Ni concentration (yellow line) starts at 0% at 0 nm, peaks at about 50% around 25 nm, and then decreases. The Ti concentration (magenta line) starts at 0% at 0 nm, peaks at about 65% around 15 nm, and then decreases. The Pt concentration (pink line) starts at 0% at 0 nm, peaks at about 20% around 20 nm, and then decreases. The W concentration (white line) starts at about 85% at 0 nm, drops to about 10% around 15 nm, and then remains low. The N and O concentrations (green and blue lines) remain near 0% throughout the range. The material analysis chart immediately below illustrates a magnified graph (along the y-axis) of the material analysis chart immediately above.

EXHIBIT A1

Claim	Tower '235 Accused Products
	GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that, in the Tower '235 Accused Products, the nickel silicide layer comprises platinum having a composition gradient, from a nickel silicide surface at a silicon interface to an opposite surface of the nickel silicide, with platinum increasing in amount in a direction away from the source/drain regions and the gate electrode, from between about 8 wt. % and about 12 wt. % at the silicon interface. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.

EXHIBIT A1

Claim	Tower '235 Accused Products
[5pre] The semiconductor device according to claim 1,	See claim 1.
[5a] wherein the nickel silicide layer has a thickness of about 100 Å to about 150 Å.	In the Tower '235 Accused Products, the nickel silicide layer has a thickness of about 100 Å to about 150 Å. See, e.g., limitation [1c].  The figure consists of two side-by-side images. The left image is a cross-sectional energy-dispersive X-ray (EDS) map. It shows a layered structure with a legend at the top identifying elements: N (blue), O (green), Si (red), Ti (yellow), W (cyan), and Pt (magenta). The layers are color-coded according to these elements. The right image is a grayscale scanning electron micrograph (SEM) cross-section of a semiconductor device. It shows a series of rectangular features on a substrate. A red dashed line connects a small red square on one of the features to the EDS map on the left, indicating that the map is a detailed view of that specific area.

EXHIBIT A1

EXHIBIT A1

Claim	Tower '235 Accused Products
	GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that, in the Tower '235 Accused Products, the nickel silicide layer has a thickness of about 100 Å to about 150 Å. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[6pre] The semiconductor device according to claim 1,	<i>See</i> claim 1.
[6a] wherein the silicon substrate comprises a strained silicon germanium (Si-Ge) layer on a silicon layer.	In the Tower '235 Accused Products, the silicon substrate comprises a strained silicon germanium (Si-Ge) layer on a silicon layer. <i>See, e.g.</i>, limitation [1c]. GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that, in the Tower '235 Accused Products, the silicon substrate comprises a strained silicon germanium (Si-Ge) layer on a silicon layer. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[7pre] The semiconductor device according to claim 1, further comprising	<i>See</i> claim 1.

EXHIBIT A1

Claim	Tower '235 Accused Products
[7a] a stress liner on the nickel silicide layer.	The '235 Accused Products further comprise a stress liner on the nickel silicide layer. <i>See, e.g.,</i> limitation [1c]. 

EXHIBIT A1

Claim	Tower '235 Accused Products
	GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that the Tower '235 Accused Products further comprise a stress liner on the nickel silicide layer. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[8pre] The semiconductor device according to claim 7, further comprising	See claim 1.
[8a] an oxide or oxynitride layer	The '235 Accused Products further comprise an oxide or oxynitride layer on the stress liner. <i>See, e.g.,</i> limitation [1c].

EXHIBIT A1

Claim	Tower '235 Accused Products
on the stress liner.	An EDS map showing a cross-section of a material. A yellow/orange layer is visible at the interface between a light-colored upper material and a blue/cyan lower material. A red dashed box highlights this interface area. A secondary electron image (SEM) of a cross-section. A red box highlights a specific feature on the surface of the material, which is the area of interest for the EDS map. An EDS map showing a cross-section of a material. A green arrow points to the interface between a light-colored upper material and a blue/cyan lower material, highlighting the yellow/orange layer.

EXHIBIT A1

Claim	Tower '235 Accused Products
	GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that the Tower '235 Accused Products further comprise an oxide or oxynitride layer on the stress liner. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[9pre] The semiconductor device according to claim 8,	See claim 8.
[9a] wherein the stress liner comprises stressed silicon nitride.	In the '235 Accused Products, the stress liner comprises stressed silicon nitride. <i>See, e.g.,</i> limitation [1c].

EXHIBIT A1

Claim	Tower '235 Accused Products
	

EXHIBIT A1

Claim	Tower '235 Accused Products
	GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that, in the '235 Accused Products, the stress liner comprises stressed silicon nitride. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[10pre] A semiconductor device comprising:	The Tower '235 Accused Products comprise a semiconductor device. <i>See</i> limitation [1pre].
[10a] a silicon substrate;	The Tower '235 Accused Products comprise a silicon substrate. <i>See</i> limitation [1a].

EXHIBIT A1

Claim	Tower '235 Accused Products
	
[10b] a P-channel transistor and an N-channel transistor, each comprising source/drain regions and a gate electrode, on the silicon substrate; and	The Tower '235 Accused Products comprise a P-channel transistor and an N-channel transistor, each comprising source/drain regions and a gate electrode, on the silicon substrate. <i>See</i> limitation [1b].  GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that

EXHIBIT A1

Claim	Tower '235 Accused Products
	the '235 Accused Products comprise a P-channel transistor and an N-channel transistor, each comprising source/drain regions and a gate electrode, on the silicon substrate. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[10c] a first nickel silicide layer on the gate electrode and source/drain regions of the P-channel transistor; and	The Tower '235 Accused Products comprise a first nickel silicide layer on the gate electrode and source/drain regions of the P-channel transistor. <i>See</i> limitation [1c]. GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that the '235 Accused Products comprise a first nickel silicide layer on the gate electrode and source/drain regions of the P-channel transistor. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.

EXHIBIT A1

Claim	Tower '235 Accused Products
[10d] a second nickel silicide layer on the gate electrode and source/drain regions of the N-channel transistor,	The Tower '235 Accused Products comprise a second nickel silicide layer on the gate electrode and source/drain regions of the N-channel transistor. <i>See</i> limitation [1c]. GF's contentions are based on information reasonably available at this stage of the case and GF's investigation to date. GF reserves the right to rely on reverse engineering and/or other testing, which will further confirm that the '235 Accused Products comprise a second nickel silicide layer on the gate electrode and source/drain regions of the N-channel transistor. To the extent this limitation is found not to be literally present, this limitation is present under the doctrine of equivalents because the Tower '235 Accused Products perform substantially the same function, in substantially the same way, to achieve substantially the same result as the claimed limitation, and any differences are insubstantial. To date, Respondents have not alleged that this limitation is not literally present in the Tower '235 Accused Products.
[10e] wherein each of the first and second nickel silicide layers comprises platinum having a concentration gradient, from a	In the Tower '235 Accused Products, each of the first and second nickel silicide layers comprises platinum having a concentration gradient, from a nickel silicide surface at a silicon interface to an opposite surface of the nickel silicide, with platinum increasing in amount in a direction away from the P-channel and N-channel transistors, from between about 8 wt. % and about 12 wt. % at the silicon interface. <i>See</i> limitation [1d].
